Now, JPS has introduced their Model NIR-12 that greatly expands the flexibility and improves the performance of DSP. It uses two separate DSP chips that operate at a 40-MHz. clock rate. With that much computing power on board, the unit can offer four separate filter functions, each of which is selectable independently. Any number of them can be used simultaneously.

The passband filters are infinitely adjustable in both center frequency and bandwidth, separately. This makes a tremendous difference in tuning. The user can tune the center frequency to any desired audio tone, then adjust the bandwidth, as necessary, to make interfering signals drop out. All the while, the filter shape factor is superb!

The notch filter automatically cancels out any number of heterodynes in the passband.

The dynamic peaking mode is a new concept; it forms a bandpass width just wide enough to encompass the desired signal, either CW or SSB. It recognizes the characteristics of speech or CW and reduces the amplitude of anything that does not fit either category. The only adjustment is a 3-position switch that calls for 6-, 12-, or 20-dB. of noise reduction. The reviewer found the 6-dB. position to be most useful. The 12-dB. level he found to be too much, and it cut into the intelligibility of the received signal; the 20-dB. setting was "overkill".

The noise interference reduction (NIR) filter is continuously adjustable by a front panel knob. In SSB operation it removes noise by canceling non-speech frequencies. At the lower settings of the knob, the filter will pass CW and attenuate the surrounding noise; but at the highest settings, it interprets the CW as noise and eliminates it.

The reviewer found various combinations of the four functions effective over different band conditions. In conclusion, he points out that, though the NIR-12 does an excellent job of suppressing many kinds of receiver noise, for line noise, computer hash, and other local, man-made interference, it is not as effective as the JPS NC-4 Antenna Noise Canceler that was reviewed in QST Feb 96.

Title>TC1:K3BC's SSTV Becomes TRUSCAN
Author>Vester, Ben - K3BC
Source>QST Jul 96, pp. 66-67
Abstract>Description of 16 modifications and improvements made to the popular SSTV computer program.

Digest>K3BC is the originator of the very popular SSTV software package introduced in articles in past issues of QST, most recently in QST Dec 94. Since first introducing the software, he has made many additions and revisions. In this letter, he outlines 16 of them.

The full story is contained in the file: VESTER_K.ZIP, which can be downloaded from the ARRL BBS at (860) 594-0306. Alternatively, he will provide the latest version of the whole package to anyone in return for a DOS-formatted, 1.44-MB floppy disk accompanied by a self-addressed and stamped mailer.

Title>Amplifier Control With the Yaesu FT-840
Author>Rosenthal, Herbert M. - WV5Q
Source>QST Jul 96, pp. 64-65
Abstract>Construction details of a relay box to facilitate using the FT-840 with a power amplifier.

Digest>WV5Q uses a Yaesu FT-840 and had problems when trying to use it with a power amplifier. To solve them, he built a relay box that performed several actions, including:
1. Grounds a specific lead so that the CW sidetone is audible in transmitting.
2. Grounds a control line to operate the power amplifier.

3. Supplies a pull-up voltage to an amplifier-control line that prevents the transceiver from transmitting without a "Ready" signal from the amplifier.

The various circuits are explained in a block diagram, and the whole circuit illustrated by a schematic plus parts list. The author states that the relay box would most likely be applicable to almost any transceiver that has a keying-control line.

Title>HK2:Tape Arrows Label Dial Settings
Author>Sasson, Maurice, I. - W2JAJ
Source>QST Jul 96, p. 65
Abstract>W2JAJ cuts arrow-shaped pieces of colored tape and attaches them to the adjustment dials on his gear to indicate the proper settings, using different colors for different bands.

NEW HAM COMPANION (NHDC)

Title>NHC1:The Doctor is IN
Author>Various
Source>QST Jul 96, pp. 51-52
Abstract>Questions and answers of interest primarily to newcomers to amateur radio.

Digest>Questions discussed in this issue include calculating an antenna's wind load; shifting a Yagi antenna from horizontal to vertical polarization; working the OSCAR 27 satellite with a dual-band VHF/UHF FM tranceiver; the need for a 28.8-kbaud modem for the World Wide Web; when the sunspot cycle will turn favorable; and other subjects.

Title>NHC2:Packet Volunteers in the Miami Olympic Classes Regatta
Author>Hirschman, Jim - K4TCV; Kandel, Joel - KI4T; and Whitley, Wes - AF4N
Source>QST Jul 96, pp. 53-55
Abstract>Radio amateur activities in connection with a popular regatta.

Digest>The Miami Olympic Classes Regatta is a four-day series of sailboat races. This year, there were more than 786 boats entered in a total of 48 races. They were run over six courses, each more than 5-miles long.

It was important for the contestants to obtain the results of the races as quickly as possible after they are run so as to plan their strategy for subsequent races. This presented a communications problem that was admirably solved by a group of radio amateurs using packet. This article tells the story.

Title>NHC3:Island-Hopping in Puget Sound
Author>Reisenauer, John - NL7TB
Source>QST Jul 96, p. 56
Abstract>Experiences in operating ham radio from islands in Puget Sound.

Digest>The author and his son operated on five different islands in the Puget Sound area during one three-day period. Four of the five qualified for the US Islands award program. They drove their pickup truck, in the cab of which is installed a Yaesu FT-747GX transceiver. At each stop, they erected a 30-foot (9.1-m.) sectional pole and strung a G5RV-type antenna from it. This article describes their experiences and the contacts they made.

Title>NHC4:The Droopy Loop
Author>Newton, Patrick - KJ7MZ
Source>QST Jul 96, pp. 57-58
Abstract>Describes an effective antenna attached to the roof of a church.

Digest>KJ7MZ describes an antenna that he built for use by his Boy Scout troop, and for other purposes, on the roof of his church. It is a full-wave square (or rectangular) loop and can be cut for either 80- or 40-meters. The 80-meter version is 272-feet (82.9-m.) in circumference; the 40-meter wire is 142-feet (43.3-m.). He used insulated wire and attached it to the roof at the four corners of the square, with the wire lying on the composition shingles.

The roof of the church is large enough to hold the entire antenna. At another location, he erected a similar antenna with two of the corners attached to the roof and the other two suspended from trees. Either antenna can be used on the band for which it is cut and, with an antenna tuner, on every higher-frequency band.

The author found the antennas to be highly effective and very inconspicuous. He cautions that the design should not be used on a metal roof.

GENERAL INTEREST ARTICLES (GI)

Title>GI1:CQ from WW2END
Author>Tomas, Bob - N7KTP
Source>QST Jul 96, p. 40
Abstract>A Special Event station on the deck of the mothballed USS Missouri.

Digest>The US battleship Missouri, on the deck of which the Japanese surrender was signed signifying the end of WW2, is in "mothballs" at the Bremerton, WA Inactive Ship facility. To commemorate the 50th anniversary of the end of the war, a group of Washington hams obtained permission to operate an amateur Special Events station from the deck of the ship for the period September 1-4, 1995. The FCC allowed them to

use the special call: WW2END, but only after they had made a direct appeal to Vice President Al Gore.

During their operations, they logged about 4800 contacts.

Title>GI2:Living, Working and Hamming in Africa
Author>Casier, Peter - ON6TT
Source>QST Jul 96, pp. 41-43
Abstract>A ham's experiences while travelling in Africa.

Digest>In 1994 and '95, ON6TT worked as a communications consultant with relief organizations in Africa. His work took him to the nations of Zaire, Malawi, Angola, Zimbabwe, and Kenya. Wherever he went, he took amateur radio equipment with him and always tried to find some time to carry on ham activities.

In the course of his travels, he encountered travel and living conditions that ranged from Spartan facilities in dangerous surroundings to luxurious resort hotels in ultra-modern, friendly cities. In this article, he recounts a number of his visits to the various countries and describes his ham activities. In spite of the pressure of work and the sometimes difficult operating conditions, he logged many thousands of contacts with stations throughout the world.

Title>GI3:A MARS Operator at Fort MacArthur
Author>Thomas, Tom - WA6WPG
Source>QST Jul 96, pp. 44-45
Abstract>A ham recounts memories of GIs' phone patches between Viet Nam and their homes.

Digest>WA6WPG was an army enlisted man during the Viet Nam war. At the end of his period of service, he was stationed for four months at Ft. MacArthur, in San Pedro, CA. He was assigned to be a MARS operator handling phone patches from servicemen in Viet Nam contacting their families at home. Since amateur radio phone patches are not private conversations and he had to operate the radio equipment, he heard every word of every conversation.

Many of the conversations were poignant in the extreme. In this article, he relates some of his memories of them.

Title>GI4:Forty Years in the Life of a Hamoholic...As Seen By His Wife
Author>Richmond, Toni - KE4TUQ
Source>QST Jul 96, pp. 49-50
Abstract>Reminiscences by the wife of an ardent ham.

Digest>Ed Richmond, husband of the author of this article, has been a ham since 1956. His present call is W4MGN and he formerly held W8KGR and KN4HNA. He holds a Ph.D. and is a college-level teacher.

During his 40-year ham career, Mr. Richmond has operated as a ham from 21 other countries, primarily in Europe and Africa. As a result, he formed friendships with hams in many countries, friendships he maintains on radio. His wife has recently received her amateur license, and she now participates with him in his ham activities.

3375. Digest of Articles - QST Aug 96 (Long - 37k)

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-19 00:00:00 UTC
From: wvanho@infinet.com
Message-ID: <51ra1g$5gk@news1.infinet.com>

Cross-posted to: rec.radio.amateur.misc,rec.radio.info

Following are digests of articles printed in the August, 1996 issue of QST. Such digests are being prepared for each issue of QST, and posted periodically. They are archived, beginning with the January, 1993 issue, and available by ftp from:

(in USA) oak.oakland.edu/pub3/hamradio/arrl/infoserv/digests
(in Europe) ftp.funet.fi/pub/ham/arrl/infoserv/digests

They also can be gotten by E-Mail from the ARRL Info Server at: info@arrl.org. For detailed instructions, send an E-Mail message containing the following:

HELP
SEND INDEX
QUIT

Another access route is via the ARRL HIRAM bulletin board. It can be accessed by a direct telephone call at any speed from 1200- to 28,800-baud. The number is: (860) 594-0306.

The major value of digests is to give readers sufficient information to decide whether to obtain a copy of the full text. If any U.S. reader wants a copy of an article in QST, please inquire of other hams in your own neighborhood. Many have collections of back issues. Anyone who is unsuccessful in finding a fellow ham with a collection should try every library in the area, especially those at universities and technical colleges. If all else fails, a copy can be obtained from the ARRL Technical Department, 225 Main St., Newington, CT 06111-1494 USA for a fee of $3.00 per copy for ARRL members; $5.00 for non-members. Remember, it is both cheaper and quicker to obtain one locally.

Readers in most other countries can obtain copies from their own national ham organizations, sometimes translated into their own languages.

TECHNICAL ARTICLES (TA)

Title>TA1:The W3KH Quadrifilar Helix Antenna
Author>Ruperto, Eugene F. - W3KH
Source>QST Aug 96, pp. 30-34
Abstract>An easily constructed circularly polarized antenna which, when aimed straight up, will communicate with satellites and show no fading, nor nulls, during an entire pass overhead.

Digest>When receiving signals from satellites in Low Earth Orbit (LEO), one faces two unusual problems. One is that the polarization of the signals changes continuously during the pass. Second, the "bird"

appears just above the horizon at one azimuth, climbs high in the sky to pass more or less overhead, and sinks toward the opposite horizon. Unless one uses a very complex antenna with two-axis rotators, computer controlled, to follow accurately the position of the satellite clear across the sky, one needs a antenna that is circularly polarized and can capture a reasonably constant signal level throughout the duration of the pass overhead. Most antennas in common use by hams fail in one or both of the requirements; either they do not respond to the proper polarization, or else they show nulls in the radiation pattern at different azimuths and elevations.

One antenna that exhibits almost perfect characteristics is the quadrifilar helix. W3KH has designed and built a version of that antenna that is remarkably inexpensive and easy to build, but also remarkably difficult to describe. The article, however, is illustrated by a number of detailed photographs, diagrams, and explanations that make it easy to visualize.

The antenna exhibits gain in the forward direction, i.e. straight up. Its radiation pattern is a single, broad lobe with a half-power beam width of about 115-degrees. The antenna is made up of two double helices, oriented at 90-degrees from each other and excited in quadrature, i.e. with a 90-degree phase difference between the respective antenna currents.

One way to visualize the helices is to consider that each is made up of two conductors, both about a half wavelength long, wrapped around an imaginary cylinder that is approximately one-quarter wavelength in diameter. Each conductor forms a helix of only one-half turn, passing half-way around an imaginary cylinder oriented vertically; each occupies one side of the cylinder, running from a point on the bottom rim to a point on the opposite side of the top rim.

The second double helix is exactly like the first, except slightly smaller in diameter, wrapped around another imaginary cylinder inside the first, with the helices of the second set offset by 90-degrees from those of the first. The helices are concentric and the actual wires are supported from a central shaft made of 2-inch (5-cm.) diameter PVC tubing. Three double crossarms, made of half-inch (12-mm.) diameter PVC tubing, hold the conductors which are made of wire stiff enough to hold their shape between supports. One crossarm in each pair is shorter than the other and each supports the small or large diameter helices, respectively.

The two sets of radiators are fed by a common coaxial cable; in fact, one of the four helical conductors is comprised of coax, which forms a balun. The two sets are made different in size to produce the proper 90-degree phase shift automatically. The larger is cut to resonate at a frequency lower than the operating one; thus, the antenna current lags in phase by 45-degrees. The smaller resonates at a higher frequency so that its current leads by 45-degrees. The result is a 90-degree phase difference between them that holds over a substantial range of

frequencies, with no sensitive tuning required.

The author provides a table giving the precise dimensions required and also explains how to scale them up or down to design a model for any desired frequency. He reports that a number of such antennas have been built for a variety of frequencies and the results have been highly successful in all cases. He finds that he gets reliable signals, without fades or drop-outs, during overhead passes from about 20-degrees above one horizon to 20-degrees from the opposite one.

Title>TA2:Install a House-Bracketed Tower - the Right Way!
Author>Brock-Fisher, Tony - K1KP and Shaheen, Bill - N1CQ
Source>QST Aug 96, pp. 35-39
Abstract>Method of attaching the lower part of an unguyed tower to the side of a house, allowing the tower to be built much higher, while not causing potential damage to the building.

Digest>Most radio amateur radio towers are either guyed or self-supporting. Guyed towers are generally much less expensive because the tower is subjected only to compression forces and the guys absorb all tensile force, whereas self-supporting towers have to stand great bending forces.

A person who can use a house, or other building, for support part way up the tower can often get the benefits of a self-supporting tower without the cost of heavy steel work near the base. To take advantage of such availability, one must be careful to ensure that the bracketing is done properly so that the added stresses caused by the tower does not compromise the structural integrity of the house.

K1KP lives in a two-story house with a gable roof and had available some Rohn 25G tower sections. A self-supporting tower built from those sections could support the type antenna he intended to use to heights of only about 20- or 30-feet (6.1- or 9.1-m.); but by anchoring the tower with a bracket attached to the house in the gable area, 30-feet above ground, he could safely extend the tower sections at least 20-feet further. With the help of N1CQ, a structural engineer, he designed a bracket system that lends ample support to the tower and spread the stresses through the attic floor joists to the main structural members of the house. Most particularly, it avoids lateral stresses from impinging on the studs in the gable section, which would not be capable of standing them. To accomplish this, he removed some of the gable studs to get direct access to the sheathing at the point where the tower bracket attaches to the outside of the house. On the inside of the attic, he ran two diagonal support beams of yellow pine, 2-inches x 6-inches x 14-feet (5-cm. x 15-cm. x 4.3-m.) to planks that span a considerable number of floor joists. A heavy steel angle bracket was used to attach the support beams to the planks.

The author points out that many local zoning boards require substantial engineering documentation before issuing a building permit. The ARRL

has assembled a list of consulting engineers who have volunteered to help amateurs satisfy the engineering requirements. Any ham can obtain a copy of the list by contacting Lisa Kustosik at ARRL Headquarters, (860) 594-0200, or via E-mail: lkustosik@arrl.org.

Title>TA3:"Intermod" - A Modern Urban Problem
Author>Hare, Ed - KA1CV
Source>QST Aug 96, pp. 40-43
Abstract>VHF communications in congested areas are often subject to interference from strong local signals. Suggested remedies are outlined, including attenuators, band-pass filters and notch filters.

Digest>Amateurs who operate on VHF bands, especially in congested areas, often complain about "intermodulation" in their hand-held or mobile transceivers. In this article KA1CV, the supervisor of ARRL's laboratory, explains what causes much of it and some of the things that can be done to minimize it.

Some of the so-called "intermod" is not intermodulation at all; it is interference caused by front-end overload, superheterodyne images, or i.f. leakage. But many of the problems really are intermodulation, which can occur in a variety of ways.

With the proliferation of all kinds of signals in the VHF range, operators will likely encounter very strong signals from nearby transmitters and on frequencies that may be not far from the ham bands. Strong signals can drive amplifiers in the receiver beyond their linear ranges, resulting in distortion and/or mixer products on frequencies where they should not be.

The simplest, and sometimes highly effective, method of defeating such interference is an attenuator in the receiver front end. A typical attenuator can be switched to reduce all input signals by 10-, 20-, or 30-dB. Very often, reducing all signals by some amount will mean that the interfering signal will drop below the saturation threshold of the amplifier concerned, eliminating the distortion.

Other ways that can be used to alleviate persistent problems include external filters. Two types are useful: bandpass and notch. A bandpass filter on the 2-meter band would strongly attenuate interference from signals generated by commercial services on other bands. In case there is one station on a fixed frequency that presents a persistent problem, a notch filter on its frequency may be the best answer.

PRODUCT REVIEW (PR)
Conductor: Rick Lindquist - KX4V
Asst. Technical Editor

Title>PR1:QST Compares: A Pair of "Six-Shooters" - The Alinco DR-M06 and Azden PCS-7500H 6-Meter FM Mobile Transceivers

Author>Budnik, Peter KB1HY and Swanson, Glenn - KB1GW
Source>QST Aug 96, pp. 63-65
Abstract>Performance reviews of two 6-meter transceivers. Both are tiny and perform well.

Digest>With the crowded conditions on 2-meter and 70-centimeter FM, more hams have discovered that the 6-meter band provides an attractive alternative. This article reviews two miniature mobile transceivers for that band.

Both the Alinco DR-M06 and Azden PCS-7500H are very small. The Alinco is the smallest at about 1.6- x 5.6- x 4.6-inches (4- x 14- x 12-cm.); the Azden is only marginally larger: 2- x 5.5- x 7.3-inches (5- x 14- x 18.5-cm.). The only significant difference in the size is that the Azden is more than 2.5-inches (6.4-cm.) deeper. This is because its power output is 50-watts, versus the other's 10-watts, and the greater depth is taken up by the heat sink on the rear.

Both units offer scanning and multiple memories. The Alinco offers 100-memory channels; the Azden 20, plus one scratch-pad memory channel.

The reviewers found significant differences in operation. The Alinco is very easy to operate and the memories are simple to program. It has a conventional lighted digital indicator on the front panel and a tuning knob for frequency control. The hand mike, with built-in keypad, is convenient and pleasant to hold. The one criticism is that the keypad is not lighted.

The Azden has a front panel display that is similar to the Alinco, but the reviewers were taken aback by the fact that it does not have a tuning knob for frequency control! Frequency adjustment is made only by up- and down-buttons that step through the band in increments of 1-MHz. or 5-kHz. While they found this system to work satisfactorily, all reviewers agreed that they would prefer a knob. The handheld mike is large and sharp-edged. It becomes somewhat unpleasant to hold for long periods, but it does have a lighted keypad that is easy to see at night.

Prospective buyers will have to choose between the two by weighing the advantages of extra transmitting power of the Azden against the operating features of the Alinco, since the prices are almost the same: the Alinco lists for $381 and the Azden $389.

Title>PR2:Brian Beezley, K6STI, RITTY 1.0 Radioteletype Program
Author>Wolfgang, Larry - WR1B
Source>QST Aug 96, pp. 66-67
Abstract>Describes a software program that will make a personal computer directly drive a transmitter in RTTY mode. It does not provide any of the other digital modes.

K6STI is well known as the publisher of antenna analysis software. He has now introduced a software program which will make a personal

computer that includes a SoundBlaster 16 sound card capable of driving a transceiver in Baudot RTTY mode. No other hardware is required except the input and output connectors which are supplied with the package. The personal computer should be at least a '386DX/40 with a math coprocessor, or better.

The software causes a tuning indicator to show on the computer monitor. As the operator tunes across a RTTY signal, the mark- and space-tones show as two peaks on a frequency-analyzer-type display. One tunes to the frequency at which the two peaks are aligned with purple marks on the screen; that is all there is to it!

Received code prints across the top of the screen, line-by-line. Likewise, in send mode, the typed characters show on the bottom half of the screen. However, neither the received nor transmitted copy is saved to a file, so there is no way to recall text after it has scrolled off the screen. If the received station's QTH, or operator's name, scrolls off the screen before a note is made of it, it is lost! Also, when no signals are being received, the program attempts to make copy out of all the random noise, filling the screen with garbage.

The reviewer was not able to make the software work under the Windows operating system, either the old version 3.1 or the current Windows 95. He found that the documentation that comes with the program cryptic and "lacking in a number of areas". There is evidence that Mr. Beezley still considers RITTY "a work in progress" and is still improving the whole package.

The purchase price, directly from K6STI, is $100. Prospective buyers should keep in mind that the program will process Baudot RTTY only; it cannot handle packet, Amtor, Pactor, or any of the other digital modes.

Title>TC1:A Possible Alternative to MATHCAD 6.0
Author>Bergstrom, Ted - W1IQW
Source>QST Aug 96, p. 70
Abstract>MATHCAD is fine, but a standard spreadsheet can perform almost all of the same functions.

Digest>This letter is a response to the review by W0IYH: "MATHCAD 6.0: a Tool for the Amateur Experimenter" in QST Apr 96. W1IQW points out that, whereas MATHCAD is a powerful program, practically everything that it can do can also be done, with slightly more effort, by any of the popular spreadsheet programs, such as Lotus 1-2-3 or Microsoft Excel. In this letter, the author duplicates the example shown in the April review, using an Excel spreadsheet. The numerical results were identical, and through the use of the Excel graph-plotting routine, a

bandpass filter loss curve was plotted similar to that of the MATHCAD output, except on a linear rather than logarithmic scale.

Title>TC2:Physically Small Inductors May Lead to Unknown Losses
Author>Michaels, Charles - W7XC
Source>QST Aug 96, p. 71
Abstract>QRP rigs need high-Q antenna tuner components at least as much as do high-power transceivers. Small inductors may waste power excessively.

Digest>W7XC points out that a number of articles describing antenna tuners for QRP use have shown physically small inductors, tacitly indicating that the small components are adequate for low power use. He points out that this is true if one is only considering the power-handling capacity of the components. But the power lost in the tuner is a function of the Q of the coils and, although a small coil will not smoke nor melt with QRP input, the loss of efficiency may be harmful to results.

Title>TC3:Measure Meter Resistance Accurately
Author>Lee, James G. - W6VAT
Source>QST Aug 96, p. 71
Abstract>Another method of measuring the internal resistance of a moving-coil meter movement.

Digest>W6VAT offers another, simpler method of accurately measuring the unknown resistance of analog meters. It does not require a special power supply.

One needs only a variable resistor that can be adjusted to a value known to be very much larger than the resistance of the meter and a power supply capable of driving the movement to full scale deflection. One connects the power supply, pot, and meter in series and adjusts the pot to set the meter to exactly full scale. Then the pot is removed from the circuit and its resistance measured with an accurate ohmmeter. Then the circuit is reassembled and the resistor again adjusted, this time to set the meter to half-scale. Again, the pot resistance is measured.

Calling the full-scale pot value R1, that of the half-scale setting R2, and the unknown meter resistance Rm, one can calculate Rm from the following formula:
Rm = R2 - 2*R1

The author notes that the accuracy by which the resistances are measured is critical to success of the method. A digital ohmmeter will assure best results.

Title>TC4:VHF/UHF Yagi Stacking Revisited
Author>Beezley, Brian - K6STI
Source>QST Aug 96, p. 71

Abstract>The author corrects his mistaken explanation of why "diamond" stacked antennas are superior to "square" stacks.

Digest>K6STI authored the article: "Another Way to Stack VHF/UHF Yagis" in QST Feb 96. He showed that if four Yagi antennas in a "diamond" configuration (one boom at the top of a tall tower, two booms side-by-side partway up, and the fourth lower on the tower) one will obtain a radiation pattern with much reduced sidelobes compared to a "square" pattern with two booms spread horizontally at the top and the other two similarly, partway down the tower.

In his article, he explained why this happens. He has subsequently discovered that his explanation was not correct and has modified it in this letter. However, the results remain unchanged: the diamond stack is superior, by far.

Title>HK1:Prevent Freezing in Cushcraft's 70-CM Boomer
Author>Mollentine, Richard - WA0KKC
Source>QST Aug 96, p. 68
Abstract>Prevent collection of moisture inside antenna tubes lest they be ruptured by a freeze.

Digest>The Cushcraft Boomer antennas are made of aluminum tubing. The ends of all the tubes are sealed by plastic caps. Over time, water can accumulate inside the tubes and subsequently freeze, rupturing them.

WA0KKC recommends filling the ends of the tubes with RTV sealant. The editor inserts a comment recommending that the plastic cap at the bottom end of any tube should have a tiny hole punched in it for drainage.

Title>HK2:The DigiBrain's Optically Encoded Tuning Knob
Author>/Craswell, James - WB0VNE
Source>QST Aug 96, p. 68
Abstract>Explains how to determine the direction of movement in a sequence of output numbers when using an optical encoded knob in electronic equipment.

Digest>WB0VNE explains how an optical shaft encoder operates. He states: "If the switch starts at 00, turning it to the right will make it step through 00,01,11,10,00. Turning it to the left would step it through: 00,10,11,01,00."

From the above sequences, one can easily detect the direction of the turn between any two steps, and design a circuit to use the information.

Title>HK3:Another Way to Feed KAMs
Author>Charavay, Fred - W8IHJ
Source>QST Aug 96, p. 68
Abstract>Provides a circuit diagram of a simple way to provide variable drive from a transceiver to a TNC.

Digest>This letter is a followup of the hint by N5LB in QST Mar 94 titled: "Simple Audio Attenuator Solves TNC Overload Problems". A circuit schematic shows a 5000-ohm pot used as a voltage divider connected across the speaker leads to provide adjustable drive to the TNC. A switch is provided to open the speaker circuit, silencing it, while not affecting the TNC.

Title>HK4:Temporary Header Jumpers in a Pinch
Author>Kanitra, David R. - WB2AZE
Source>QST Aug 96, pp. 68-69
Abstract>Describes how to make a substitute for a computer jumper from a short piece of stranded wire.

Digest>When the author was installing a larger hard drive into his computer, he needed a new jumper. Since it was not possible to obtain one quickly, he fabricated a substitute out of a 2-inch (5-cm.) piece of stranded wire. He stripped about 1/4-inch (6-mm.) of insulation from each end, then used needle-nose pliers to remove enough strands that it would occupy a space half the size of the pin. Then he bent the jumper in the middle and placed one end on each of the pins to be connected. The fit must be snug enough that the jumper cannot fall out.

Title>HK5:Modifying the FT-2400 for Packet
Author>Bergstrom, Theodore - W1IQW
Source>QST Aug 96, p. 69
Abstract>Describes a modification to the Yaesu 2-meter rig to adapt it for packet operation.

Digest>W1IQW adapted his FT-2400H for 2-meter packet with no difficulty by using the connections on the 8-pin microphone connector. However, this left the speaker active so that the received signal is audible at all times.

He determined to modify the rig to make it possible to disable the speaker by inserting a plug into the external speaker jack without, at the same time, removing the audio from the microphone jack. In this letter, he relates, step-by-step, how to do this in that particular transceiver.

Title>HK6:Make High-Quality Ladder Line at Home
Author>Johnson, Paul - W7KBE and Schetgen, Bob - KU7G
Source>QST Aug 96, p. 69
Abstract>How to assemble ladder line without having to thread the conductor wires through holes in the spacers. Similar techniques were

in universal use by hams in "ancient" times (pre-WW2).

Digest>The authors illustrate by a photograph and two easily-understood diagrams how they make parallel-wire ladder line out of No. 12 wire and small pieces of bare circuit board material from which the copper foil has been stripped. A hole is drilled through the board near each end.

In the letter, they state that most people who have previously made their own ladder line used spacers through which the twin conductors must be threaded. Their recommended means is to lay the wires out straight and parallel, put each spacer in place, and fasten it to the conductors by means of short lengths of fine-gauge wire through the hole at each end of the board, used as tie-wraps around the respective conductors.

Any ham who is old enough to have operated before WW2 would certainly testify that the method they illustrate was in practically universal use in the days before common availability of coax cable. In those days, any ham who would go to the trouble of threading the wires through holes in the spreaders would have been objects of pity, if not worse.

NEW HAM COMPANION (NHC)

Title>NHC1:The Doctor is IN
Author>Various
Source>QST Aug 96, pp. 53-54
Abstract>Questions and answers of special interest to newcomers to amateur radio.

Digest>The questions discussed in this issue include the effect of aging on coaxial feed lines; how a Yagi antenna works; grayline propagation; the expense of amateur radio as a hobby; ham clubs; CDROM drives; and other subjects.

Title>NHC2:An Aeronautical Antenna Farm
Author>Taylor, Terry J. - WB5JFM
Source>QST Aug 96, pp. 55-58
Abstract>Describes all the different kinds of equipment aboard commercial aircraft that use different parts of the radio spectrum.

Digest>Commercial airliners carry a great deal of radio gear operating on frequencies from VLF to microwave. This article describes a number of types of systems they use.

Some aircraft use the Omega system for navigating. It operates by virtue of transmissions from eight stations scattered around the world. The transmissions are on 10-KHz., in the audio range! Another navigation guide is automatic direction finding (ADF) equipment that operates between 190- and 1750-KHz.

Aircraft that fly international routes operate HF transceivers to communicate with air traffic control (ATC) centers. VHF is used by marker beacons and the VHF omnidirectional range (VOR) equipment, which is the most widely-used navigation system of all. There are several other systems, including navigation, voice, and data communication channels in the VHF range. The UHF part of the spectrum is used for landing aids, radar transponders, radio altimeters, and aeronautical telephones. Microwave is used by weather radar and also the Global Positioning System (GPS), now coming into wide use for navigation and precise positioning.

Title>NHC3:There's No Place Like Home
Author>Gauland, Michael - AA7JF
Source>QST Aug 96, pp. 59-62
Abstract>Describes how to establish one's own "Home Page" on the World Wide Web.

Digest>/Anyone who has explored the World Wide Web knows what is meant by a "web page": a combination of graphics and text that is just like a page in a magazine. Now it has become very easy for any individual who is connected to the Internet and World Wide Web to have their own "home pages".

Hams are establishing home pages and posting photos of themselves, their shacks, their antennas, short biographies, and other personal information. Now, anyone who has QSOs with them will have the opportunity to know them better by seeing their web pages.

To establish a home page, one needs to learn how to use the Hyper Text Markup Language (HTML). Use of this language makes it relatively easy to assemble attractive assemblages of photos, drawings, graphs, and printed matter in a wide variety of type sizes and styles.

Anyone can probably find basic books on the HTML in their local libraries. Also, one can use a search engine (such as Yahoo!) to find online resources of many kinds. Once people learn to create pages and gain practice at it, they can contact their Internet Service Providers (ISPs) to learn how to post the pages online.

Almost all ISPs provide web space for their clients. Many include the service in their basic charge; others make additional charges. Anyone who finds that their ISP charges too much for the service, might want to check around. It is a very competitive business and anyone should be able to find a supplier that provides home pages for very little additional cost beyond that of their normal Internet access fees.

GENERAL INTEREST ARTICLES (GI)

Title>GI1:Reflections on a Repeater in Paradise
Author>Homsany, Michael - AH8E
Source>QST Aug 96, p. 28-29

Abstract>Describes amateur radio operations in American Samoa.

Digest>AH8E moved to American Samoa in 1987 and has lived there almost continuously ever since. Soon after moving to the islands, he discovered that the coverage of the only VHF repeater was not adequate and decided to establish another one. In this article, he describes some of the difficulties he faced and tells the story of how he was eventually successful.

Title>GI2:The Radio Amateurs of Ceuta and Melilla, and Gibralter
Author>Pataki, George - WB2AQC
Source>QST Aug 96, pp. 44-45
Abstract>The author meets hams in Ceuta, Melilla, and Gibralter.

Digest>Ceuta and Melilla are two small cities that are part of the nation of Spain, although they are located on the coast of Morocco, across the strait of Gibralter. W2AQC recently visited both cities, as well as the island rock of Gibralter. In all three places, he became acquainted with a number of hams. This short article describes his travels and contains more than ten photos of some of them.

Title>GI3:Underground Radio
Author>Bedford, Mike - G4AEE
Source>QST Aug 96, pp. 46-48
Abstract>Cave explorers can use VLF radio to communicate underground. Describes the type of equipment and frequencies used.

Digest>Cave exploring, or "spelunking" as it is known in the USA, is not a hobby for everyone. But there are many dedicated adherents in the US, Britain and France, as well as other countries. Because of the inherent dangers involved, it is clear that good communications underground are a great asset.

G4AEE points out that very low frequency (VLF) radio penetrates rock and earth relatively well. This is because the wavelengths are so enormously long at the frequencies used that all practical communications (of a few hundred feet, at most) are well in the "near-field", where induction prevails. Magnetic fields are not attenuated by rock and soil the way electrical fields are, so can penetrate relatively well. Antennas are multi-turn loops tuned to resonance with capacitors. Hence, they act something like the windings of a transformer coupled through magnetic lines of force.

In both the US and the UK, transmitting on VLF still requires licensing, even though the range is limited to a few hundred feet. However, in the US, radiation below 10-KHz. is not regulated, at all, so there seems to be no impediment to radio transmissions at 9.9-KHz. This is not true in the UK.

The author points out that operating conditions in caves are almost always difficult. Everything is usually wet, muddy, slippery,

confining, and dangerous. Transmitter power is limited by the capacity of portable batteries and signal strength drops not with the inverse square of distance, as in the case of "far field" propagation, but rather with the inverse cube! Therefore, to double the range requires eight times as much power. However, the same effect can be obtained by making the antenna loop eight times larger in area. Practical considerations of confined space limits the size of most underground antennas to no more than about one meter (39-inches) in diameter, but G4AEE and his associates have had good results with that size antenna in caves of all sorts.

Title>GI4:The BayGen Freeplay Windup Radio
Author>Lindquist, Rick - KX4V
Source>QST Aug 96, pp. 50-51
Abstract>Describes a hand-wound, battery-less radio.

Digest>In many of the countries of Africa, and other underdeveloped areas of the world, radio broadcasts are extremely popular and transistor receivers are common. However, the cost of batteries severely limits their usefulness. In an attempt to overcome that limitation, a radio powered by a hand-wound spring-operated motor-generator has been developed. It contains a "clockwork" motor driving a tiny, 3-volt d.c. generator that powers it. There is a hand-crank on the side of the radio that winds up the spring with about 30-seconds of cranking. This will run the radio for about 30-minutes until it needs rewinding.

The receiver covers three bands: the AM broadcast band, the FM broadcast band, and a shortwave band from about 3- to 12-MHz. On the back of the set is a coaxial power jack through which the radio can be powered by an external source of 3- to 9-volts d.c.

The ARRL lab tested one of the radios and found to put out about 16-milliwatts, which was reasonably adequate in a quiet environment. When used with an external 9-volt source, the audio power increased about 6:1.

The radios are being manufactured by the BayGen Freeplay factory near Capetown, South Africa. The factory is subsidized by various UN agencies and the Red Cross. Initial investment capital was put up by British foreign aid, a South African insurance company, and the "Body Shop" cosmetics company.

The factory hires many disabled workers. The radios are sold at cost, about $40, to humanitarian agencies. They are also being sold, for higher prices, in ordinary retail outlets. They can be bought in the USA for $106, including domestic shipping from WindUp Technology, Inc., 7012 22d Avenue NW, Seattle, WA 98117-5625.

>we fall. Not just the "old farts" but all. And if you do not want the
>equivalent of a CB service then you better figure on how you will
>insure only those who are willing to work to be Hams are Hams.
>

What matters is if one is technically qualified ... i.e. understands how the radio(s) and other gear work, how to tell if they're broke, and how to fix 'em ... and I don't think it matters a damned bit if they got this knowledge by studying to be a ham, if they know the stuff because it's their profession (better yet ... they'll know more than most hams), or if they just woke up one morning and found that, though the Grace of God, the knowledge had fallen into their heads ... as long as they know it ... truly know it, not just have memorized the answers without "knowing" it ... I don't care ...

>That to me is what the Code is all about, a hurdle over which the lazy
>can not pass. Only those who are willing to put forth the effort
>should become hams. If we take away the a Code then we need to replace
>it with another hurdle.
>

Why? Why does there HAVE to be a "Hurdle"??? We're not trying to keep people out ... we just want them to know how to use the gear, and how to operate courteously without being a bunch of assholes, right???
(clearly the code does not keep out assholes ... just listen on 20m or 80m and you'll have proof readily at hand ..)

I have no use for the "no pain, no gain" mentality ... there's no honor in working hard if one can work smart ... only a stupid person or a masochist would value something more just because it "hurt" more to get it ... the "hurt" does NOT make the end result more valuable ...

>Finally, Carl. After reading your responses I think I know you. We are
>not that different. You are a "techie", you like being on the cutting
>edge where things are happening and you can be challanged. The problem
>is you expect all other hams around you to be the same as you.

NO, I don't expect all hams to be like me ... I just would appreciate it if they'd stop insisting that I (and others like me) be like them ...

>
>Do not devalue our Ham License by giving it away, Please.
>

Paul ... nobody is talking about giving it away ... I've advocated tougher technical tests across the board ... we just want to modrnize and eliminate an obsolete requirement that doesn't fit today's world.

We have more to fear from the governent if we're perceived as technically backward (which we are, as a service) than from a bit of bickering amongst ourselves over change ...

Morse Code and CW are being used interchangably ... there's nothing
really novel about using the code on radio vs on a wire ... so the
underlying "technology" (the code) has been around for a LONG time.

SSB was not widely used in radio until around the 1950s when equipment
became practical (much of it produced by my one of my old employers ...

>
>As far as dying modes - isn't SSB dying out, except on the Ham and CB
>bands? Most other communications seem to be FM or digital, due to the
>increased noise immunity.

SSB is still holding its own among the other services. It is still used for international airline communications, is still used extensively by the military, is used by marine services, and has some uses in the point to point services. It doesn't appear to be increasing in share, however, despite attempts to revitalize it with ACSSB. As you suggest, FM or digital (including SS) are supplanting it for some uses (as appropriate to the various spectral segments and usages concerned), and likely will do so to a greater degree in the years ahead. But CW is already, for all practical purposes, dead outside of anachronistic uses by radio amateurs.

Of course amateurs are *allowed* to use some anachronistic methods (though not all, spark is well and truly gone). But since the Part 97 rewrite, amateurs (other than Novice or Tech Plus on the 80m, 40m, and 15m Novice segments) are not *required* to use Morse (other amateur classes may use data modes on these segments, though they must respect the Novice power limit), except on 50.0-50.1 MHz and 144.0- 144.1 MHz (which are the *only* CW exclusive frequencies in all of amateur radio, and where a Morse speed test is not required for access [go figure]).

The previous paragraph may seem convoluted, but is written that way to satisfy the nitpickers. In essence, the only spectrum which is required to be exclusively CW in all of amateur radio is spectrum where a Morse speed test is not required for access. This says volumes about the government's view of the legitimate need for Morse speed testing as an access criteria.

3386. PUBLIC NOTICE ON VANITY CALL SIGN APPLICATION ELECTRONIC FILING

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-19 00:00:00 UTC
From: "Bart Jahnke, KB9NM ARRL/VEC" <vec@arrl.org>
Message-ID: <324168F2.301F@arrl.org>
Source record: 216529

PUBLIC NOTICE

Federal Communications Commission
1919 M St., N.W.
Washington, D.C. 20554

Release Date: September 18 , 1996

Wireless Telecommunications Bureau Makes the Amateur
Station Vanity Call Sign Request Available for Electronic
Filing on September 23, 1996

On September 23, 1996, an electronic version of the
Amateur Station Vanity Call Sign Request form, will be available
on the Internet at Federal Communications Commission Wireless
Home Page (http://www.fcc.gov/wtb) under Amateur Radio -
Interactive Vanity Call Sign. Detailed filing instructions are
available by clicking on the item number on the Internet form.

Electronic payment is not yet available and applicants must
mail a completed FCC Form 159 (FCC Remittance Advice)
with payment to Federal Communications Commission,
P. O. Box 358994, Pittsburgh, PA 15259-5994.

For technical assistance, please contact the FCC Technical
Support Group at (202) 414-1250. For general questions
regarding the application, please call the Wireless
Telecommunications Bureau, Consumer Assistance
staff at 800-322-1117.

3387. Re: 4-5 kw Generator Recommendations??

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-19 00:00:00 UTC
From: Doyle.Souders@nsc.com
Message-ID: <Dxzo3M.KA@nsc.nsc.com>
Source record: 216530

After many recommendations to go with the Honda generator I went to the local Home Depot to check it out. It turns out that the generator is still a Coleman generator but it has a Honda engine. Apparently Coleman offers generators with Briggs and Stratton, Tehcumseh, and Honda engines. It looks like the actual generator is similiar on all with the exception of the power rating. Since several of the posts indicated high (140v) output voltage when unloaded I am wondering whether Coleman generators are just lower quality in terms of regulation?? Or is the Coleman generator with the Honda engine still a good deal. It sounds like it will be a lot quieter and the engine reliability is better. Any other thoughts???

Thanks again for enduring these questions but this is a fairly large purchase and I would like to make sure I have all the info before making the plunge.

3388. FS: DC Pwr Plug: Ken, Icom,Yaesu,Alinco

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-19 00:00:00 UTC
From: n2cjj@LOCALNAME
Message-ID: <b19.9/21/95M52.758239@LOCALNAME>
Source record: 216531
Cross-posted to:
rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.shortwave,rec.radio.swap

I have found a source for those DC power cord plugs. The ones I've got
have 6 pins, male plastic with metal female (barbed) inserts.

The plug fits most 12VDC HF radios:
Icom 720, 735, 706.. and alike, newer Yaesu models and Alinco DX70.
Kenwood-TS120, 130, 140..430, 440, 450..850,..TS50,60, 660, 670...and alike.

Make your own power cord yourself, YOUR WAY!
Crimp or solder, long or short, heavy gauge wire, purple with polka-dots...

I'm offering the 6 position plug with 6 inserts for $4 each,
or a deal 3 for $10. All prices include postage in the US.

To order, kindly send a check to:

R. Langston
286 Hudson Street
Cornwall-on-Hudson, N.Y. 12520

You can also email me for info at: n2cjj@ibm.net

It's a great deal if you use one rig at home, in the car and at work and
are stuck dragging one power cord all over....

I still can't believe AES, HRO and others get $30 for a power cord. HiHi!

Sorry, wrong. Paul is correct on a theoretical level. An infinitely
narrow signal received with an infinitely narrow filter offers the
best detection possibility of any system. Unfortunately, an infinitely
narrow filter has an infinitely long settling time, so throughput is
zero.

Shannon tells us there is another technique with an identical possibility
of detecting a weak signal. That's the case where the signal has infinite
bandwidth. A perfect correlator will then yield the best possible detection
threshold. Unfortunately, correlating an infinite bandwidth also takes
infinite time (at least with known techniques), so throughput is again zero.

So the unmodulated signal, either maximally narrow or maximally spread,
has the best probability of detection. Neither is very useful, however.
As you move to a greater than zero bandwidth to allow the filter to settle
in a finite time, detection possibility decreases, but throughput can become
non-zero. Similarly, as you constrain bandwidth to less than an infinite
value, detection possibility decreases, but correlation in finite time
becomes possible and throughput can become non-zero.

At first blush, it might appear that these two techniques would
converge at a single middle value. That is not so. For any finite
information rate, there will be two points of maximum detectability,
one nearer zero bandwidth, the other nearer infinite bandwidth.
Only in the case of an infinite information rate will the two
points converge, and perversely, have the *worst* probability of
detection. In fact, the probability of detection will be precisely
zero in that case.

>Properly coded signals can "combat" and "avoid" the noise by trading

>unmodulated (or OOK'd) carrier will still be received in a finite
>bandwidth, so it will always have noise to contend with ... as you
>reduce the bandwidth arbitrarily to lower the noise floor, the amount
>of information you can convey is proportionately reduced ...

Coding gain doesn't help you if you can't detect the signal. Shannon sets a hard limit on that of -2 db Eb/No. It is not even theoretically possible to do better, no matter what coding you use. Note that Eb/No is not necessarily the same thing as SNR. It *is* possible with proper coding to work with much more negative SNR values than -2 db. An amateur example is PACTOR II, which can work at a SNR of -18 db. That's below the threshold of detection for the human ear (The human ear, properly trained, is a fairly good, but slow, adaptive filter and can detect signals at a SNR as low as -10 db.), but not below the threshold of the DSP in the PACTOR II box. Note that this corresponds to an Eb/No of about +10 db. Voyager's techniques are better in that they can work at +4 db Eb/No. That means that at least 6 db of Eb/No improvement beyond PACTOR II is possible with known techniques, and that can translate into a much larger improvement in post-detection SNR. For this style of coding, the two are related by the base 2 log of the difference in Eb/No multiplied by the *rate* (also sometimes referred to as the *order*) of the code used.

Coding gain can be applied to the narrow or the spread signal. And it will improve the post-detection SNR of either method. Coding is not free, however, and costs effective throughput. To keep throughput constant, bandwidth must be increased in the narrow case, and narrowed in the wide case, so both techniques start to approach the deadly middle. However, the percentage change in bandwidth for the wide case is less than for the narrow case, so for finite values of throughput, coding gain benefits the wide signal more than the narrow one.

This analysis has only considered the Gaussian channel. Spreading can have other benefits for the interference riddled fading channel which make it even more advantageous.

Kerwin,
I'm not sure if you are saying someone else is running the voice deal
thru the repeater, or the repeater is running the voice deal. Anyway, seems
like the repeater owner should know who it is, and if it's him, the id'er on the
repeater should cover it, I would think. Check the CW id'er on the repeater
and contact the owner of the repeater.

In article <51fuad$71e@feldspar.mica.net> vroberts@rpa.net (Vince Roberts) writes:
>Don't waste your time and money on the Gordon West tapes. Get Code
>Quick for a little more than 20 bucks more. It works, or he'll give
>you your money back. Won't get that from Radio Shack

Don't use Code Quick unless you want to have to *relearn* Morse
as you go for higher class licenses. It'll get you through 5 WPM,
but you'll have to *unlearn* the mnemonics before you can get to
13 WPM, and have to relearn the letters as unitary sounds. This
is an unnecessary (and often frustrating and very time consuming)
step that you should avoid. There are effective drill methods which
allow you to learn the letter sounds directly at 20 WPM. They take
very little longer to do, and get *all* the code testing out of the
way in the most expeditious manner possible.

Note, as is readily apparent to many, I have no love of Morse,
but I have helped many people to overcome the barrier to getting
an upgraded license and do know something of what works efficiently
and what doesn't. Code Quick is not an efficient way to achieve the
higher speeds currently necessary for upgrades past Novice or Tech
Plus. (13 WPM is all you really need since Extra offers no significant
privileges over Advanced, but it is very little harder to learn from
scratch at 20 WPM than it is at 13 WPM, so you might as well do that.
Increasing speed above your initially learned speed later is harder
and more time consuming than learning it fast in the first place.)

Note too that the Gordon West tapes, or tape based systems in
general, aren't that much better than the Code Quick system,
though they do avoid the mnemonic trap. That's because you
quickly memorize them, and their utility for drill becomes
negligible. The best methods use computerized drills custom
tailored to your progress. SuperMorse and Morse Academy
(available off the net) can be setup to offer such tailored
drills using the Koch method (or the varient I've written about
here before, which appears to be even more efficient due to
being based on information theory and signal space mapping
considerations).

Once you pass 13 WPM (which is above the speed at which lookup
table associations such as those used in Code Quick or dot and
dash counting methods fail to work any longer), on air practice
can also be helpful in motivating you to increase speed further.
Before you reach this speed range, however, you'll still be
fighting the mnemonics (or dot and dash counting) that you'll
have unfortunately burned into your neural nets by using inferior

training systems, so on air practice will be of little practical benefit, and may serve only as a source of frustration.

You *can* build speed gradually from a low initial level, it is the "traditional" way, but it is also a colossal pain in the ass, and takes much longer than more efficient drill techniques which bypass the speed "hump" where you have to unlearn your initial decoding strategy and learn a more efficient one. Many people stall at the hump, and never achieve higher speeds, or reach them only after prolonged struggle. Learning initially at a higher speed avoids this trap.

A final caveat, one size does not fit all. Everyone will need some customization of instructional technique for best results. What works well for one person may not work well for another. Don't be afraid to change techniques if the first one you choose isn't achieving the desired results. But do be aware that all the strategies take time to work, so give them a fair trial before going to another method. The Chinese found in Korea that it took on average 57 days to achieve the desired level of brainwashing in their captives. Conditioning the brain to be a 20 WPM Morse decoder is likely to take a similar amount of time. (Though it may take longer without the incentive of repeated beatings and constant fear of death.)

The "Spectre of CB" again, eh? Please describe what CB has to
do with the amateur radio service? The history of what happened
to the Citizen Band has been discussed here many times before
and it had nothing to do with a code test and everything to do
with the FCC not enforcing the regulations. If you want to prevent
the amateur bands from following the same route, I'd suggest
you help the ARRL in its efforts to force the FCC to increase
instead of decrease enforcement of its regulations.

> To the No-Coders, you will win. But ask yourselves while your

> all lose!

This fracturing has already occurred. It started before incentive
licensing, got worse with incentive licensing, and really split
us apart with the change in the technician class license in 1991.
Seems to me that to eliminate this fracturing we need to eliminate
our current class based licensing structure.

> The Industerial/Communication Services out there will eat us

> insure only those who are willing to work to be Hams are Hams.

"work to be Hams are Hams"? What's that mean? Whether someone
works at it or not is completely irrelevant. It's how they behave and
contribute that matters.

> That to me is what the Code is all about, a hurdle over which the lazy
> can not pass. Only those who are willing to put forth the effort
> should become hams. If we take away the a Code then we need to replace
> it with another hurdle.

Why? What's the purpose of having a hurdle? There seems to be little
evidence that supports jumping through a hurdle does anything other
than cause people to jump through a hurdle. How does it relate to
what we want amateurs to do? How does a hurdle make a person

a better amateur?

> And somewhere I remember being told that "that which is not earned but
> given freely away has no value."

Because you heard it makes it true? I personally have little value in
busy work. I value my license for what it allows me to *do*, not for
what I *did* to obtain it. Those that feel a need to be rewarded for
exerting effort are free to participate in all the various amateur
related competitions. They'll be rewarded for what they did, not
what they can do.

If you really believe that's all the knowledge necessary to safely,
and without causing harm to others, operate amateur radios, then I'd
suggest you should put away your radios until you learn what is really
required to do so.

Isn't using IP on top of a UI AX25 datagram for all intensive purposes,
using them "naked"? I mean, you have no underlying transport layer other
then IP. It was my understanding that the whole AX.25 encapsulation mess
came about as a way to satisfy U.S. requirements. I do know there is a
driver out for NOS (from Poland) that will drive a radio directly
from the UART port (a modified form of SLIP). I've also used a
Livingston
PortMaster running slip to talk to a multipoint spread spectrum based
network we have set up here in Farmington. (and in fact thats how I am
posting this message)

However, I do agree with Brian Kantor. Some sort of underlying transport
layer really helps on long circuits (like AX.25 VC mode). That way you
error check on your most fragile path (the radio path).

Regards,

Jeff WB8WKA

Coleman got bought out, I believe. There's a difference between the old
REAL ones and the new ones. As for the girls, can they fix generators?

Quebec is pronounced (roughly) kay-bec in *French*, but it's usually
pronounced kwe-bec in *English*. It would seem better to have chosen
a word without this ambiguity, such as queen.

How much "knowledge" is needed by CB folks to safely operate their
radios.

Now, granted, the power limits are a little different, but the same
general concepts apply.

>
> What was the reason for changing?

The example given is the ICAO, or International Civil Aeronautics
Organization phonetic
alphabet. English is the universal language of civil aviation, but
obviously not all pilots
are native English speakers.

The changes were intended to make it less likely that a non-native English
speaker would
mis-interpret a word in the phonetic alphabet. While all the words are
English (except
for Quebec, perhaps), the idea was to find words that non-native speakers
would be
familiar with anyway. For example, "Nan" or even "Nancy" is a given name
familiar to
native English speakers, but perhaps not to a pilot from China. On the

other hand,
"November" is an English word that is needed and probably learned very early in the
process of learning English as a second language. In general, given names were replaced.

"Mike" remains, not as a given name, but as the slang term for "microphone", which is
something a pilot would be expected to know. "Golf" is pretty well-known over the world.
I don't have a good explanation for keeping "Charlie".

Quebec is pronounced as KAY-bec, which seems like a bad choice, since it starts with
a sound that suggests the letter "K". However, there just aren't many good choices for
"Q", and at least the city and province are well-known. In quite a few other languages, the
sound associated with "Q" is more often like "K".

And yes, adding more syllables increases redundancy. If I hear over the radio (*** means
a burst of static noise): ***n, I would have a hard time coming up with "Nan". But if
I hear ***vember, then I've got it.

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 19/2330Z SEPTEMBER 1996 BY IPS RADIO AND SPACE SERVICES
FROM THE AUSTRALIAN SPACE FORECAST CENTRE
SUMMARY FOR 19 SEPTEMBER AND FORECAST FOR 20 SEPTEMBER - 22 SEPTEMBER

1A. SOLAR SUMMARY
Activity: Very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 69/3

GOES satellite data for 18 Sep
Daily Proton Fluence >1 MeV: 1.3E+06
Daily Proton Fluence >10 MeV: 1.8E+04
Daily Electron Fluence >2 MeV: 1.2E+08 (moderate)
X-ray background: A1.2
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
20 Sep 21 Sep 22 Sep
Activity very low very low very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 20 Sep: 70/5

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: Unsettled to active

Estimated Indices : A K Observed A Index 18 Sep
Learmonth 14 2323 3343
Fredericksburg 10 17
Planetary 15 18

Observed Kp for 18 Sep: 4135 5333

2B. MAGNETIC FORECAST
Date Ap Conditions
20 Sep 15 Unsettled
21 Sep 15 Unsettled
22 Sep 15 Unsettled
COMMENT: IPS Geomagnetic Warning 10 was issued on 19 September
and is current for interval 23-26 September.

3A. GLOBAL HF PROPAGATION SUMMARY

Latitude Band
Date Low Middle High
19 Sep Normal Normal-fair Fair
PCA Event : None

3B. GLOBAL HF PROPAGATION FORECAST
Latitude Band
Date Low Middle High
20 Sep Normal Normal Fair
21 Sep Normal Normal Fair
22 Sep Normal Normal Fair
COMMENT: HF conditions at high latitudes are expected to degrade
over the next 7 days.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Date T index
19 Sep -8

Observed Australian Regional MUFs:
Darwin: 15-30% depressed for the period 0000-1100UT,
otherwise near predicted monthly values.
Townsville: 15% depressed for the period 0000-1400UT,
otherwise near predicted monthly values.
Sydney: 15-30% depressed for the period 0000-1300UT,
otherwise near predicted monthly values.
Hobart: 15-30% depressed for the period 0000-1200UT,
otherwise near predicted monthly values.

Predicted Monthly T index for September: 9

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
Date T index MUFs
20 Sep 5 near predicted monthly values
21 Sep 5 near predicted monthly values
22 Sep 5 near predicted monthly values

> who knows? maybe he even has the judgement to know when not to go as well
> (unlike a recent unfortunate event with a small kid and transportation..)

He seems to be a pretty good sailor with safety in mind, since he
used a generator _and_ batteries to power his radio(s). If I were
to cross such a distance, I'd make sure to check in every n hours
(which he did apparently, until his power ran out). He announced
his loss of power IIRC, so you can't blame him for that.

Back on topic: did he use marine HF equipment as well or did he
rely on amateur radio alone? However, my congratulations to him.

Just my $.02,
Jens, DB9LL

EMERGENCY FUNDING

The following is an important closed circuit advisory. Attention all bulletin stations. Newsline is once again on the verge of bankruptcy and existing hand to mouth. We urgently need your support to survive.
As we have said many times, the decision whether Newsline stays or goes is yours. If you want this service to continue, we will need your ongoing financial support, and it is needed right now.
The address for the Newsline Support Fund is:

NEWSLINE
P.O.Box 660937
Arcadia, California
91066

This ends the closed circuit with Newsline report number 996 for release on Friday, September 13, 1996 to follow.

(*****
The following is a QST

Hams in the Carolinas face the fury of Hurricane Fran as a CBer in Arizona faces the wrath of the FCC. Find out more about both on a special extended Newsline report number 996 coming your way right now:

(*****
HURRICANE FRAN

Packing winds in excess of 105 miles per hour, Hurricane Fran hit the United States along the Carolina shoreline near Cape Fear at about 10 PM Eastern time on Thursday September the 5th. According to the Reuter news agency, ham radio operators in the Myrtle Beach South Carolina clocked winds in excess of 120 miles per hour in their reports to the National Weather Service. The storm submerged beach towns, ripped steeples off churches and snapped trees into sticks as it roared through the Carolinas. At least a dozen were people were left dead in its wake.
According to news reports, ham radio was a vital link in coordinating all aspects of this emergency. When the Shenandoah National Park closed Skyline Drive in Virginia and evacuated visitors, ham radio carried a part of the message. Hams also assisted in the pullout of over a half-million tourists and residents had been ordered to evacuate the coast in North and South Carolina. More than 19,000 people packed shelters overnight, shelters manned by volunteer workers standing side by side with ham radio communicators.
Earlier in the day, hams were put on alert as Hurricane Fran approached the southeastern coast. Much of the activity was on 75 meter SSB with South Carolina ARRL section manager Mike Epstein, KD1DS, activating an ARES and RACES net with the state SSB net serving as backup. The Georgia state emergency SSB net was on 3975 kHz while the Virginia state emergency nets held forth on 3910 kHz and 3947 kHz, respectively. Jerry Herman, N3BDW, reports that the Hurricane Watch Net was activated on 14.325 MHZ in coordination with the National Hurricane Center station W4EHW, in Miami as the storm approached.
In North Carolina, hard hit by Fran, Gary Pearce, KN4AQ is the ARRL Public Information Coordinator in Raleigh:

"We have an HF net operating, the Tar Heel Net operating on 3923. VHF nets on all the repeaters that are still standing. Most of the major repeaters managed to survive the hurricane. There have been over 8000 people displaced into shelters across the eastern part of the state. And amateur operators are manning most of those shelters. Providing communications in areas where telephone support is not available." KN4AQ

One of the big casualties of Fran has been cellular telephones. In reality, cellular phones are nothing more than a radio link to the wired telephone network. When the wires come tumbling down everyone tries to use their cellular phones. The remaining lines get overloaded and service goes away. That's where ham radio takes over. Again, Gary Pearce, KN4AQ:

"The NWS office here in Raleigh lost telephone service very early in the store and attempted to use cellular phones to provide backup. And were unable to get any cellular connections because the cellular circuits were overloaded. So we have staffed the weather service office with an amateur until just a few hours ago when their phone service was finally restored." KN4AQ

And seeking about the National Weather Service. Many hams put themselves at risk to keep their communities and the NWS informed of Fran's devastation on a local level. Throughout the night and into the morning hours of Friday the 6th, hams primarily using 2 meter FM, kept the media

and the world informed with reports like that of a tornado touching down on a bridge near Wilmington and power lines touching and exploding on a bridge just outside of Wilmington and power lines sparking in wind at Surf City. As we go to air, Hurricane Fran is nothing more than an unpleasant memory for many and a night that hams along the U.S. east coast will never forget.

(*****
HAM TO FLY TO HURRICANE FRAN

With Hurricane Fran keeping radio amateurs busy in the Carolinas, another ham was getting ready to head toward the main strike zone even before the eye of the storm had moved ashore.

For one radio amateur, Fran means business. Brian Peters, WD4EPR is a National Weather Service Meteorologist. While Frans eye was moving ashore in North Carolina, Peters was getting a phone call at his home in Birmingham. The weather service assigned him to be part of a natural disaster team to survey Frans damage.

"They have arranged to have either the NOAA plane or to have a Civil Air Patrol plane at Sea with myself and possibly a couple other folks will be in the plane to do an aerial assessment of the extent of damage and to try to do an aerial mapping if you will, of the damage that occurred. To get some idea of how extensive the wind field was from the storm." WD4EPR

Peters says projects like this help increase our understanding of just how devastating a hurricane can be.

"Last year when we had Hurricane Opal affect Alabama is we basically had at least gusts to hurricane force very much further inland than what most people were anticipating. And so it's going to be really interesting here to be able to, to try to get a handle on the extent of the wind field associated with the, what will become a dissipating hurricane. And to see exactly how far inland this wind field does extend." WD4EPR

Peters job was to be mostly in the air, flying over areas hit hard by Fran. He will be taking notes, shooting still pictures, and recording video. Hurricane Fran is just part of what has made 1996 a noteworthy year for Brain Peters. He spent 7 weeks in Atlanta during the summer, helping provide specialized weather services in support of the Olympic Games.

"And now doing Hurricane Fran. You know it has been and interesting year." WD4EPR

What is like to follow in the wake of a storm like Fran? That part of the story when Brian Peters returns.

(*****
ARRL WILL ASK CHANGES IN RF SAFETY RULES

The ARRL will seek reconsideration of certain aspects of new RF exposure safety rules as they apply to the Amateur Radio service. Newsline has learned that the League's executive committee has authorized the filing of

a petition for partial reconsideration of the Report and Order in the FCC's RF safety Docket 93-62. While details are still a bit sketchy, it is our understanding that the League will claim that the data used in formulating the new rules was flawed. Therefore the action taken to create them is arbitrary and shortsighted.

(*****
WHITE HOUSE AND ARRL GET CB'er FINED $6000 FOR HARASSING AZ HAMS

The Arizona Repeater Association, the ARRL's Amateur Auxiliary and the First Lady have teamed up to bring the wrath of the FCC down on a CB operator. A CBer who the FCC says spent the last four years harassing legitimate ham radio operators in Phoenix, Arizona.
Timothy H. Hoffman has been issued the Notice of Apparent Liability to Monetary Forfeiture in the amount of $6000. This, after being charged with transmitting on the amateur bands without a valid license, willfully and maliciously interfering with the radio communications of licensed radio amateurs and failure to allow a station inspection by FCC personnel.
The action against Hoffman comes after members of the Arizona Repeater Association working hand in hand with the ARRL's Amateur Auxiliary went the political route. According to Lance Halle, KC7FVX of the Arizona Repeater Association, for about four years Phoenix repeaters have been plagued with what he termed as vile, malicious interference. The alleged culprit would mimic legal hams, use their callsign and cause all sorts of vulgar interference. Especially with nets and phone patches.
Halle says that the CBer had several followers and that they would selectively wage war on one ham after another. This included death threats and phone harassment to blind ham perpetrated via area autopatches.
Halle tells Newsline that almost two years ago Arizona Repeater Association's Local Interference Committee located the individual, and turned him in to the FCC. At that time there was still a manned monitoring facility nearby in Douglas, Arizona. The agents running the facility had been following this interference for several years and were delighted with the information supplied by the ham radio group. They were quick to pay him a visit one evening while he was singing vulgar lyrics over a Swap Net and issue a Notice of Violation.
That stopped him for a couple of months, but soon he was back on the air. He taunted local hams telling everyone that even the FCC couldn't stop him. KC7FVX says that the Interference Committee and it's staff of Official Observers continued to DF, record, and document his activities. Since he was unlicenced they forwarded this info to both ARRL and FCC. After about a year of no action, with the approval of the ARRL they began a letter writing campaign to congress and the President of the United States. Enter the White House and the first lady. A few weeks ago Halle says that received a letter from the Chief of the FCC's Compliance and Information Bureau. It stated -- and we quote --

"First lady Hillary Clinton requested I answer your inquiry."

The FCC official went on to indicate she was aware of the case, but since it was under investigation, she could not divulge any information. Shortly

thereafter Halle received responses from three congressmen who had also heard from the FCC. The big surprise came when the $6000 Notice of Apparent Liability was issued to Hoffman.
Halle says that it seems the system does work, but needs a little help now and again from congress. He says that A lot has been learned from this experience, both locally and by ARRL. That the ARRL's volunteer Official Observer program and Local Interference Committees are effective in combating this type of problem although sometimes you do have to go the political route. Halle adds that none of this would have been possible without the hard work of the ARRL's Amateur Auxiliary to the FCC.
Hoffman was given the usual thirty days to respond to the Notice of Apparent Liability. At air time it is unknown if he plans to file an appeal.

K7UGA SUFFERS MINOR STROKE

Amateur radio's elder statesman has been hospitalized in Phoenix, Arizona. We have word that retired Senator Barry M. Goldwater, K7UGA, was admitted on Monday, September 9th to St. Joseph Hospital in Phoenix after suffering what family members call a minor stroke.
According to his daughter Joanne Goldwater, her father had gone to the hospital for some tests. During the evaluation it was found that he had suffered the stroke. A hospital spokesman confirmed that the stroke was very minor and that Barry had not suffered any paralysis. The spokesman says that K7UGA's release from the hospital will depend on the results of further tests.
President Clinton visited Senator Goldwater in his hospital room on Wednesday the 11th. He later told reporters that Barry spoke very clearly and that the well known Goldwater smile was the same.
Get well wishes can be sent to:

Barry Goldwater - K7UGA
at his Callbook address.

LEGAL SEMINARS AT ARRL CONVENTIONS

A Continuing Legal Education seminar with a long title will be presented at two ARRL conventions during October. Called "Land Use Regulation of Federally Licensed Communications Facilities and the Doctrine of Federal Preemption" its first outing will take place when ARRL General Counsel Chris Imlay, N3AKD, and Mike Raisbeck, K1TWF, will present the seminar. This, at the New England Division Convention, October 4, at the convention site, the Holiday Inn, Boxboro, Massachusetts. Imlay and Phil Kane, K2ASP, will present a CLE seminar October 18th, at Pacificon '96, at the Hilton Hotel, Concord, California.
Credits will be available for both seminar sessions for a nominal fee. Otherwise, the seminars are free.

(*****
PHASE 3 D LAUNCH DATE APPROACHING

The launch of ham radios next shining star could come a lot earlier than previously thought. Construction of AMSAT's Phase 3D satellite is well along and the French have now cleared the Ariane 502 booster to fly. Phase 3D is more than just a replacement for the aging Oscar 13. The technology being carried to space by this bird will usher in a whole new era in ham radio orbital relay communications.

(*****
SPY BIRD

The London's Daily Telegraph reports that a fragment of an Ariane rocket traveling at 31,000 miles per hour vaporized a portion of France's Cerise spy satellite last month. The collision destroyed part of the six yard long gravity stabilization boom of the satellite.
Using Russian and U.S. tracking technology, scientists at the University of Surrey were able to determine that the debris originated from a 1986 final stage failure of an Ariane rocket. Ironically, the Cerise satellite -- used by the French military to map radio emissions was also launched aboard an Ariane last year.

(*****
SUNSAT

One of the more unusual projects riding on the SUNSAT experimental satellite slated for launch in March of 1997 is an experiment that will monitor the internal sounds of the spacecraft during the early part of its mission in space. Through this experiment, it should be possible to hear things such as the gravity gradient boom extending and locking into place, creaking sounds caused by thermal changes to the spacecraft structure, and sounds from the reaction wheel assemblies. Sounds from the spacecraft will be available in real time through a 2 meter FM downlink transmitter, and promise to hold a lot of interest.

(*****
GB2RS CHANGE

From the Radio Society of Great Britain comes word that the 2 meter GB2RS news broadcast at 9:30 AM local time in Cornwall is now repeater relayed.
Starting on September 1st, the broadcast is being made through the north Cornwall repeater on repeater channel R5. This is a test period of four months. The purpose of the experiment is to improve coverage in this difficult terrain.

(*****
WINDTRACKS

It has been a busy summer for members of the Central Indiana Balloon Experimenters Group. Windtracks 9 launched its third balloon for the summer from a school in Howard County. Kokomo hams working with students at the Greentown Central Middle School helped launch and recover a three package payload.
The balloon rose to nearly 100,000 feet before bursting and floating back to earth. During its two hour flight, hams checked in from Wisconsin,

Ohio, western Pennsylvania, central Illinois, and from all over Indiana. Pictures could be seen from the onboard camera at sites in Ohio and Pennsylvania.
The students ran the 2 meter and 75 meter nets. The packages were recovered about twenty miles from the launch site.

DX

In other DX news, look for G4FUI on the air from Lesotho portable 7P8. Martin plans to operate both CW and SSB. You have until early December to work him. QSL via G4FUI.

And WA4DAN plans to operate portable CY0 from Sable Island from October 22nd to the 29th, including the CQ World Wide SSB Contest. Other team members are AH9C, KW2P, VK2BEX, and AA4VK.

TT8SP has been very busy from Chad. Check out 18.070 MHz at 16:30 UTC, 10.102 MHZ at 23:30 UTC and between 14.003 to 14.019 MHZ after 20:00 UTC. He has also been on the low end of 80 meters at 04:30 UTC. QSL via F5OIJ.

(*****
JOHN P. ALEXANDER, K6SVL, SK

And some sad news for the DX world. John Alexander, K6SVL, of Rancho Palos Verdes, California, died of cancer on August 30th at age 73. John was the Southwestern Division representative to the ARRL DX Advisory Committee. ARRL Southwestern Division Director Fried Heyn, WA6WZO has fond memories of his friend of more than two decades:

"I remember him 20 years ago when he took us under his wing at the DX Convention in Visalia. I'm heart broken about it and it was really the best rep that I have had in the DXAC." WA6WZO

In addition to serving on the DXAC, John was active in local DX organizations and was a past president of the Southern California DX Club. John was also a lifetime friend of Newsline and he will be missed by all.

(*****
HIRED HACKER

And finally, what do you do when you lock yourself out of your computer
and can't remember your password? Hire a computer hacker of coarse. That's
what a California school district did a few weeks ago, and repercussion are
being heard statewide.
It seems that students at Palisades Park High School needed transcripts
to send off with college applications, but they were all in the school
computer and nobody who knew the password could be reached. The school
principal was away on vacation and could not be reached. Another employee
had suffered a stroke and everyone else was either on vacation or away
working at other jobs.
So the school superintendent apparently gave the green light to hire a
hacker. But not just any hacker. The person hired was a sixteen year old
who was able to break the secret code and get the needed transcripts out.
And he did not work for free. After he completed his mission he billed the
school system $875 based on a fee of $25 an hour.
Right now school officials are still trying to justify the expense to
the school board. That could go on for some time. But it should make us
all ask the question of who says that there is no entrepreneurial spirit
left in todays youth?

> on the 440 Ham Bands ? Specifically 442.150 TX and 447.150 RX .
>
> What is required to reprogram the radio ?

Assuming the radio covers the ham bandsplit, you will need the Motorola
programming software and the special adapter and cable. This is usually
too costly to purchase for doing only a single radio, even if you (God
forbid!)
get a bootleg copy of the software (I have heard that some "dealers"
give it away when selling the radios).

Try to find someone who will program it for you, or bring it to a Motorola
shop and pay the $40 or so. If you are going to get into these radios (and
they are quite decent, BTW) you can spend some time trying to collect
the necessary stuff to do it yourself. I am sorry but I cannot help you as
I have neither the cables or the software.

If the radio is not the correct bandsplit, some versions of the software
can
be overridden by holding the shift key pressed when entering the freqs
(except
for the decimal point) and the freq will then appear unshifted when you
enter
each one.

Good luck!

Only if they're completely unable to pass any element of the test ...
probably only a few percent ... retesting will also allow the inactives
and silent keys to be purged from the FCC database ...

However, the current "extras" who don't know Ohm's law would be
"demoted" to a level comensurate with their demonstrated competence.

That's be rough on them, for sure ... they'd have to admit that they're
not really superior to some no-code tech who knows how radio works ...

>personally thought the survey was loaded toward reducing or eliminating
>the morse test requirement.
>

I think that the majority answering the survey may well lean
towards the keeping the code test ... however, I think that's because
the ARRL "membership" consists of two factions ... the "old guard" (who
favor CW above anything and everything) and the "subscriber-member" ...
the guys like me who ONLY send their $xx/yr to Oldington to get QST
delivered every month ...

>As one who works day to day with the latest in telecommunications
>technology, I can say with confidence that in a very short time, using
>ADSL technology, voice, video and 1.44 megabit data will be available to

>so easy and cheap in the next few years, even the most advanced SS HF
>radio amateur modes will be obsolete by comparison of cost/performance.
>Mankind is ready to once again "jump the curve."
>

I agree that new technology will provide great service at low cost ...
but I still think that there should be a place for a modern, advanced
ham network ... the phone company and the rest of the internet are
vulnerable to outages, particularly in times of disaster, because of the
distributed nature of their physical plant (cables).

A modern ham network, as a part of the global internet, could provide
robust connectivity, albeit not at T-3+ rates, that would span the
breaks in the global network at the times and places where it was most
needed.

I firmly believe that there is still much that hams can do to advance the state of the art and to provide meaningful public service.

I fear that we've become too much of a nostalgic "just a hobby" for our own good and continued survival ...

>Will ham radio still be fun? Yes, as a window on an earlier time, an
>earlier technology, whether you enjoy morse, CLOVER, RTTY, SSB or some
>other mode.
>

Fun it in the eye of the beholder ... CW is NOT fun to MANY ... it's a useless pain to be endured to many ... as a "window to the past" ham radio holds no particular value to me ... as a "window to the future" it's priceless ... I think many feel that way, but the establishment insists that they look backward and resists their attempts to look in the direction where they can provide the most benefit to the service and to the public ...

>alternative views are proposing solutions that are more divisive than
>useful.
>

So the code should be forced down everyone's throats, because SOME
SEGMENT of the ham community views it as "important" (to them).

That makes ZERO sense, Ed ... how would the CW folks like it if the
digital folks forced a test in coding software algorithms for DSP on
them? After all, those skills are *important* to a(n ever-growing)
group of hams ...

Sounds like a *practical* test to me ... write some software routines
that implement an FFT, a Hilbert transform, do some digital modulation
and demodulation, complex filtering, etc. ... maybe even implement
some convolutional codes and a Viterbi decoder or two ... Would the CW
folks find this an appropriate *pass/fail* test element? (If not, WHY?)

I would submit that jaming things that they don't consider relevant down
people's throats will *always* generate some "devisive" feelings on the
part of the "jamee" ... yet that's what the code folks have been doing
to everyone for years and years ... and we're sick and tired of it ...
to quote "Network" ... "We're mad as hell and we're not going to take it
any more!"

If that's "devisive," so be it ... I guess we need some "dividing" ...
it's not always bad to stir things up a bit ... unless all you care
about is maintaining the status quo at all costs ...

I like the idea of class recertification ... and introducing new,
updated theory/technical material ... drop the code and it's perfect.

>What
>better way to keep a pool of skilled technical talent current on the
>latest technology, regulations and theory?
>

You're going to be increasingly unable to convince newcomers that the
code is relevant ...

>
>Working towards lowering the standards by which you must still retain
>those privileges does not improve the Amateur Radio Service, it has the
>opposite affect.

Dropping the code test does not lower the standards in any relevant
terms ... since increasingly larger numbers of prospective hams find the
code irrelevant ... the only "value" in the code is the "value" that's
assigned to it by its afficionados ... nothing more ... "we like it" is
not a relevant criteria for determining legal licensing requirments.

>CW serves a purpose which is to provide a challenge to
>those people who desire to earn the Amateur Radio License and the
>privileges that come with it. I don't know about you, but I enjoy a
>challenge.
>

We don't consider it a challenge ... we consider it a useless, very
distasteful, ordeal, nothing more ...

I like a challenge, too ... for me, it's designing something that works
better, faster, and more reliably ... and costs less ...

However, having a "challenge" to "overcome" is also not an appropriate
reason for extablishing a licensing "requirement" ... that's sort of
like saying ... "We can make the driver's license holder appreciate his
license more by tying his hands behind his back and making him wear a
blindfold for the driving test ... that'll provide some challenge and

make him appreciate the license more, so he'll be a better driver for having overcome the challenge." (DUH!!!)

The issue that's being debated here is "what are appropriate licensing qualifications?"

What (even the majority of) current hams *think* or *want* is actually totally irrelevant ... it is the FCC's legal responsibility to determine the *absolute minimum* qualifications that are in the public interest (and "the public interest" goes FAR beyond the ham community .. that includes safety, rules compliance, and the theory/technical knowledge necessary to assure technical compliance of operations without interference to other services ... nothing more.

(NO, I'm NOT advocating a CB ... technical tests are, and will always be necessary, but the code has outlived its time as a necessary licensing requirement.)

Paul I missed this first time around. Let me straighten you out on a
few things.

Pro Coders are not all Code Nazis I have never said that. The honorific
has to be earned. You have to do things like call handicapped people
lazy, accuse anyone who is not pro code of wanting a free lunch
persoanlly insulting those with whom you disagree. If you read this
newsgroup regularly you can easily figure out who they are.

When I started out in amateur radio I was interested in code as part of
the ham radio mistique. The pro code cretins on this group and .policy
have driven me from that to end the code test activism. Fortunatly ham
radio in general is not relflected in the usenet newsgroup so I have
maintained an interest. If amateur radio is to survive it need numbers
not worship of some sophomoric hazing ritual.

>we fall. Not just the "old farts" but all. And if you do not want the
>equivalent of a CB service then you better figure on how you will
>insure only those who are willing to work to be Hams are Hams.

Good comment and one that cries out for all hams to look
towards the future... not the past. As to willingness to work, that
is not a quality you can test for. It may be a desired trait, but
there are people that learned CW without really trying, just as there
are people that can learn and pass theory tests with little
or no effort. See more below:

>That to me is what the Code is all about, a hurdle over which the lazy
>can not pass. Only those who are willing to put forth the effort
>should become hams. If we take away the a Code then we need to replace
>it with another hurdle.

Hurdles, assuming there should be any at all for the sake of
establishing that someone is a worker, MUST be relavent
to the need for testing. CW, in the 21st century, does not
serve that purpose well at all.

>Finally, Carl. After reading your responses I think I know you. We are

One point to bear in mind is that some countries only have "gentleman's agreements" about how the HF band works NOW. As long as the bandplan has the general agreement of amateurs, then it will be followed.

You perhaps missed the original comment where the communication was supposed
to promote international UNDERSTANDING. Hardly possible with that kind of
QSO.

And what Ham principle is it that, I wonder? Are you suggesting that we should
still be using spark transmitters? - nothing's much simpler than that. I thought
experimentation and development was part of ham priciples, have I got it wrong?

I don't have any problem with that. I take the view that the exams are too easy, but then on the other hand, I work in the industry, so I guess my expectation of what an amateur should know, may not be totally objective. This, however, is off-topic on the items which were originally posted on why Morse is so good.

I didn't bother to respond on the comment about Morse being the best mode to get through in all conditions as Phil Karn's reply did so very well.

>signal considering the 250ft cable lenght? If afirmative what could I do
>to correct it?
> Is an antenna tuner needed considering that the antenna (dipole) is cut
>to the desired frequency?

Andre, 50 ohm coax is suitable for feeding a resonant dipole. If the dipole is resonant on the band you intend to use, the SWR should be below 2:1, so you won't need an antenna tuner, though you should use a 1:1 balun at the feedpoint (a simple choke balun will work, IE about 6 turns of the coax about 6 inches in diameter should do, or ferrites slipped over the coax at the feedpoint will do too).

RG-58 has too much loss with a 250 foot run. I suggest that you use RG-8 or Belden 9913 instead. Moderate length runs of RG-58 are Ok on the lower end of HF, but become pretty lossy toward the upper end. You also can't run a lot of power through RG-58 due to the losses causing too much heating, and due to the possibility of flashover if SWR is high. A 100 watt transmitter can get away with 50 feet of RG-58 on the lower end of HF if SWR is reasonable. But 250 feet is a long run, so you should use a lower loss cable.

At VHF, even 50 feet or RG-58 is undesirable, and you should use a better cable. Belden 9913 is a good choice, as is The Wireman's 4XL, hardline is an even better choice.

Caveat: if the band for which the dipole is cut is 160m or 80m, you may need the tuner in order to cover the entire band without SWR foldback problems with your transmitter. On 40m and above, the 2:1 SWR bandwidth should be broad enough not to require a tuner. If you do need the tuner, that implies SWR on the cable will be high, so use of the lowest loss cable you can obtain would be indicated. (Open wire line is often used in such cases because its excess SWR losses are very low. But it can be a pain to route if you have to go through a building, so low loss coax is still the preferred choice.)

The ARRL Letter
Electronic Update
September 20, 1996

IN THIS UPDATE:

* Electronic Form 610V to be available for Gate 2
* Hams aboard Atlantis!
* ARRL National Convention a success
* Hams help nab "Pizza Dude" and friends
* Solar activity dips
* Alabama ham plates get new look
* Prolific QST author marks 80th birthday
* Ham astronomer honored
* Vern Riportella, WA2LQQ, SK
* In Brief: Help wanted; New Kansas SM;
Quote of the month; Hams to be honored;
Thanks!; Info on older Kenwoods

ON-LINE VANITY CALL SIGN FORM TO BE AVAILABLE SEPTEMBER 23

There's good news and bad news about the FCC's plans to provide for electronic filing of vanity call sign requests. The good news is that an electronic version of the Amateur Station Vanity Call Sign Request Form 610V will be available starting at 12:01 AM EDT on September 23, 1996. Applicants can access the form on the Internet at the Federal Communications Commission Wireless Telecommunications Bureau home page, http://www.fcc.gov/wtb, under Amateur Radio-Interactive Vanity Call Sign. Detailed filing instructions are available by clicking on the item number on the Internet form.

The bad news is that electronic payment is not yet available. The FCC said that applicants must mail a completed FCC Form 159, FCC Remittance Advice, with payment to Federal Communications Commission, Box 358994, Pittsburgh, PA 15259-5994. Note that this is a different Post Office box and ZIP code than for vanity requests and payments using hard-copy forms.

For technical assistance, call the FCC Technical Support Group at 202-414-1250. For general application assistance, call the Wireless Telecommunications Bureau, Consumer Assistance staff at 800-322-1117.

SHUTTLE ATLANTIS CARRIES THREE HAMS INTO SPACE

Three hams are aboard space shuttle Atlantis, which was launched at 0854 UTC Monday morning. Astronauts aboard include Jay Apt, N5QWL; Carl Walz, KC5TIE;

and John Blaha, KC5TZQ. Blaha will spend 120 days as a resident on the space station Mir, replacing Shannon Lucid, who has been living on Mir for the last six months. The shuttle docked with the station on Thursday to make the exchange and to pick up and drop off materials and equipment at Mir.

STS-79 is carrying the Shuttle Amateur Radio EXperiment (SAREX) payload in configuration M. Configuration M is voice-only operations on a downlink frequency of 145.84 MHz FM. Voice uplinks are on 144.45 and 144.47 MHz. Packet radio is not on Atlantis this mission.

Alan Crowder, KC7KCG, in Seattle, Washington, reports making the first 2-meter contact with N5QWL while in his car using a half-wave vertical running 25 W. Reports were 59 on both ends. Other hams have also successfully contacted N5QWL and the other hams aboard.

The crew has three prearranged contacts with schools: Andover Middle School in Andover, Kansas (September 20); Immaculate Conception Elementary School in Celina, Ohio; and the Royal School For Girls in Haslemere, Surrey, England (September 22). The students have been preparing for their contact for several months. These contacts will occur after the shuttle has docked with Mir. Random contacts will also be made with the ham community.

Amateurs should check W1AW bulletins and AMSAT SAREX bulletins for Keplerian elements and information about possible random contact opportunities. SAREX operating frequencies and additional information can be found on the ARRLWeb SAREX page, http://www.arrl.org/sarex/.

GOOD WEATHER, CROWD MARK NATIONAL CONVENTION IN PEORIA

Clear, cool weather and a good turnout highlighted the 1996 ARRL National Convention September 13-15 in Peoria, Illinois. ARRL Executive Vice President David Sumner and ARRL President Rod Stafford, KB6ZV, fielded questions at the ARRL Forum. Popular topics included the new FCC RF safety standards and the future of Morse code as a requirement for HF privileges. NASA Astronaut Dr Charles Brady, N4BQW, was a huge hit at the SAREX Forum and at the banquet.

HAMS CHARGED IN PHONY "PIZZA DUDE" POLICE CALLS

Three ham radio operators from Mesa, Arizona, have been arrested and charged in the wake of a nearly year-long spree of false distress calls and profane transmissions on police, fire and ham radio frequencies. One of those interfering with police calls had identified himself on the air as "Pizza Dude." The trio, reportedly led by a 16-year-old former Mesa Police Explorer Scout, faked reports of bomb scares, carjackings and robberies, and officers in distress, according to an August 20 report in The Arizona Republic of Phoenix. Investigators said they also played music on emergency channels and harassed police dispatchers. "They taunted us for months, saying they wouldn't get caught," the newspaper quotes police Sgt Ben Kulina as saying. On some occasions, police dispatched officers in response to the false calls.

Members of the Arizona Repeater Association's Local Interference Committee located the troublemakers and helped police and FCC officials to obtain enough evidence to make the arrests. In late July, the Committee heard reports of abuse of the 911 emergency system on two local repeaters. Serious interference to one Mesa machine was occurring almost nightly. Similarities between the repeater interference and what Mesa police had been experiencing for nearly a year led to a cooperative arrangement between the ARA and authorities. Lance Halle, KC7FVX, chairman of the Interference Committee, reports that within a couple of days, two of the perpetrators were located (using DF equipment) and the information relayed to Mesa Police. The police--with help from city communication officials, the FCC and local hams--started keeping an eye on the suspects, monitoring, recording and DFing. "The FBI was brought in for voice-print analysis to insure an airtight case," Halle said. When enough evidence was gathered, the arrest warrants were issued.

Taken into custody and charged were 20-year-old Christopher R. Johnson, KC7QPJ, and two 16-year-olds, Brad E. Shelley, KC7JQY, and Joshua D. Cavender, KC7JGH. Johnson and the teenagers were charged with interfering with public safety frequencies, impersonating a police officer and false reporting. Halle said the suspects' radios, computers and telephones were seized. The trio also may face FCC sanctions.

The Local Interference Committee is an ARRL-recognized organization within the Amateur Auxiliary Program. All members of the ARA Local Interference Committee are ARRL Official Observers.

SOLAR ACTIVITY DIPS

Solar prognosticator Tad Cook, KT7H, of Seattle, Washington, reports that solar activity was down from September 5 to September 11, with the sunspot numbers below the 90-day average of 71 on every day of the period. Solar flux was down an average of more than 4, and sunspot numbers were down an average of 11 compared to the week previous. Solar activity was down again during the period September 12 to September 18. Average solar flux was down about a point, and average sunspot numbers were down about 3.7. Every day except September 12 had no visible sunspots. The daily solar flux was below the 90-day average of 71 on each day over the past week. Solar activity is expected to increase over this week, with solar flux to peak in the mid 70s around September 24-16. Geomagnetic conditions are expected to peak around September 25 with A indices around 25 and K indices as high as 5. After October 1 solar flux should drop below 70. Geomagnetic conditions should get unstable again around October 7-13.

The days are growing shorter, and the fall equinox will arrive September 22. Because of less daylight, 20 meters is becoming more of a daylight band.

Sunspot numbers for September 5 through 11 were 0, 0, 15, 15, 0, 0 and 0, respectively, with a mean of 4.3. The 10.7-cm flux was 70.3, 69.7, 69.5, 68.2, 67.9, 68, and 67.6, respectively, with a mean of 68.7. Sunspot numbers for September 12 through 18 were 11, 0, 0, 0, 0, 0 and 0, respectively, with a mean of 1.6. The 10.7-cm flux was 67.8, 67.3, 67.1, 66.4, 68, 69, and 68.9, respectively, with a mean of 67.8.

ALABAMA HAM PLATES GET NEW LOOK

No more same ol' same ol' for Alabama hams who want to display their call signs on their vehicles. New ham radio license plates in Alabama will clearly indicate "Amateur Radio" below the owner's call sign, thanks to the efforts of Lawrence Thompson, KE4RPX, of Montgomery, Alabama. Thompson--a former Kentucky lobbyist turned Anglican priest--serves as the state government liaison for the Alabama Section. Section Manager Tom Moor, KL7Q, approached him about the subject, and Thompson got on the phone. Three calls later, he had an appointment with the state official responsible for license plates. "One hour later, I met with this man in his office," Thompson relates. "Twenty minutes later, I had his approval to begin designing a new Amateur Radio license plate." Thompson, himself, took on the task of designing the distinctive ham radio plate, after the Motor Vehicle Division granted his request and dissuaded him from holding a design contest. The Amateur Radio legend is in red across the bottom of the new plates, which also display a tower on the left-hand side.

The official told Thompson that, in 26 years of working at the division, no one had even asked him about the possibility of a new design. Alabama has 10,000 hams, but fewer than 20% of them have ham radio license plates, which cost an additional $3.

Thompson reports that Alabama was the first state to permit ham radio license plates, passing the legislation in 1951.--Alabama Section News

PROLIFIC QST AUTHOR CELEBRATES 80TH BIRTHDAY

O. G. "Mike" Villard, W6QYT (ex-W1DMV) of Woodside, California, celebrated his 80th birthday September 17. Between 1941 and 1994, Villard authored or co-authored more than two dozen articles for QST. His first contribution was "Operation from Three-Wire Power Lines" in June 1941. Most recent was "Simple Equipment for HF Fox Hunting," in August 1994.

"The 53-year record is virtually unchallenged in the history of QST, and is striking for the variety of subjects that have attracted our interest for in-depth investigation," ARRL Executive Vice President David Sumner, K1ZZ, wrote in a congratulatory letter to Villard which concluded, "When can we expect the next article?"

HAM-ASTRONOMER HONORED

Dr James M. Moran, K1AKE, has been awarded the 1996 Karl G. Jansky Lectureship by Associated Universities Inc and the National Radio Astronomy Observatory. The Jansky Lectureship is awarded for outstanding contributions to the advancement of astronomy. Moran, a professor of astronomy at Harvard University, is best known for his application of the techniques of very long baseline interferometry (VLBI) to the study of astronomical masers. Masers are the radio equivalent of lasers. VLBI allows astronomers to image celestial objects at a level of detail unmatched by any other technique. In a recent spectacular result, Moran and his colleagues used VLBI observations of a rotating disk of masers near the center of the galaxy NGC 4258 to show that the galaxy's center contains an enormous black hole with a mass 36 million times that of the sun.

Moran credits Amateur Radio with starting him on his career path. Encouraged by his father, James M. Moran Sr, W1QUO, Moran was first licensed at the age of 13. The senior Moran is a longtime amateur, and his son still vividly remembers being shown a wood-chassis transmitter with a 35T tube that his dad had built in the 1930s. At his dad's suggestion, Moran decided to build a radio telescope for a high school science-fair project. He bought a World War II surplus military 430-MHz downconverter that provided input to his Hallicrafters SX-100 HF receiver. The results were recorded on a chart recorder. With this rig and a 6-foot-long helical antenna, he detected radio emission from the sun and won the top prize in the science fair.

Moran is a graduate of Notre Dame and the Massachusetts Institute of Technology. A staff member of the Smithsonian Astrophysical Observatory since 1970, he also is a professor of astronomy at Harvard University. He lives in Concord, Massachusetts, with his wife, Barbara, an Episcopal priest. The couple has two children. Moran holds a private pilot's license and also enjoys squash, tennis, hiking, camping, photography and windsurfing. He still maintains a weekly CW schedule with his dad on 20 meters.

The National Radio Astronomy Observatory is a facility of the National Science Foundation, operated under cooperative agreement by Associated Universities Inc.

VERNARD RIPORTELLA, WA2LQQ, SK

Former AMSAT-NA president and QST columnist and author Vern "Rip" Riportella, WA2LQQ, of Warwick, New York, died September 13, 1996, of an apparent heart attack. He was 52. A former US Air Force officer, Riportella was the third president of AMSAT-NA and served from 1984 until 1987, and he's credited with being a prime mover behind OSCARs 10 and 13. "Rip" served for a time as the editor of QST's "Amateur Satellite Communications" column and wrote several articles for QST on satellites. He also founded the AMSAT Satellite Report (now the OSCAR Satellite Report).

In more recent years, he was involved in the installation and upgrading of packet radio equipment aboard the Russian space station, Mir. Services will be private. His wife, Ellen, survives. Condolences may be sent in care of the Strong-Basile Memorial Chapel, 75 Main St, Warwick, NY 10990 or to the family's mailing address, Box 177, Warwick, NY 10990.

In Brief:

* Help wanted: The ARRL Washington Office has an opening for an electronics engineer (BSEE or equivalent experience) with spectrum-management experience. Duties would include representing the interests of Amateur Radio to US government agencies, the ITU and regional organizations. Public speaking ability, professional-quality writing and the ability to deal with people from other countries are essential. Spanish language skills are a plus. Send resume and salary expectations to R. Boucher, ARRL, 225 Main St, Newington, CT 06111; fax 860-594-0298.

* New Kansas SM: Mike Brungardt, WA0SXR, of Newton, Kansas, is the new Kansas section manager. He succeeded Gary Bliss, NZ0M, effective September 16, 1996.

* Quote of the month? FCC Chairman Reed Hundt, in London offering his "Seven Commandments" for telecommunications competition: "How many licenses should be auctioned? As many as can be found in the airwaves. What if the spectrum is already lightly used? Allow auction winners to relocate the existing users at no cost, so that the market can clear spectrum. How should the spectrum be used? Any way the auction winners want: no restrictions; no rules; total flexibility."

* Hams to be honored: The Radio Club of America will honor three well-known hams November 22 at its annual banquet in New York City. Carole Perry, WB2MGP, will receive the Barry Goldwater Amateur Radio Award; Frank A. Gunther, W2ALS, will get the Frank A. Gunther Award; and Fred. M. Link, W2ALU, will receive the President's Award.

* Thanks! Fred Hammond, VE3HC, has donated a number of equipment racks and other items that will come in handy as the ARRL Lab renovates its screen room. Test Engineer Mike Gruber, WA1SVF, will be installing the equipment this month.

* Info on older Kenwoods: Kenwood is offering FTP access to many Kenwood service bulletins and application notes via the Internet. Visit the Kenwood FTP site from Kenwood's Web page, http://www.kenwood.net/ (click on What's New at Kenwood) or directly at ftp://ftp.kenwood.net. The FTP site includes Kenwood equipment bulletins and notes dating back to 1975.

3436. Hamfests in Dallas area 28-29 Sept ??

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-20 00:00:00 UTC
From: John Evans <jaevans@cos.cst.titan.com>
Message-ID: <3242A08C.138E@cos.cst.titan.com>
Source record: 216388

Greetings,

Are there any hamfests or swapmeets in the Dallas area the weekend
of September 28-29 ??

Thanks in advance for the info !!

73, n3qoo

John A. Evans Chief System Administrator
Office: (719) 528-1800 x164 Titan Client/Server Technologies

Cross-posted to: rec.radio.amateur.misc,rec.radio.swap

Yaesu FT40, 99 Channel radio. Includes tx/rx mod, tx and receives from 430 -484.This unit is LITERALLY the size of a pack of smokes, maybe a TINY bit deeper, but the same height and width. (Just add an antenna.) Does 99 channels PL _AND_ DPL, Keypad programmable, dual VFO, digital voice (record up to 20 seconds from the radio or by mike and either play back through speaker OR back on the air! Record you call and never say it again! Searches PL & DPL (yep, don't know the PL? Just hit a key, and it tells you! (I Can't find this in the manual, I think it;s a hidden trick.) Comes with low power battery pack, charger, manual, and box. Barely used. Would prefer Bay Area (California) but will ship. $300/BO. Must sell ASAP, make an offer. Either reply via e-mail, or call 415-939-1037 anytime. Thanks

Evan

>came about as a way to satisfy U.S. requirements.

No, AX25 serves a real purpose. It forms the MAC (Media Access Control)
layer for the upper layers. Here are some of the things it does.

1) It provides the CS part of CSMA by holding off transmission when
another carrier is sensed on the channel.

2) It provides the leading flags needed to synchronize the HDLC clocks.

3) It provides the Txd to handle transmitter and receiver settling times.

4) It provides a way to avoid repeated collisions through its p-persist
and slottime parameters.

5) It provides the hardware addresses in its header to which logical
IP addresses are mapped (via ARP). (Hardware and logical addresses
must be separate if multiple protocols are to be supported.)

6) Its PID byte allows multiple higher level protocols to co-exist
to/from the same hosts, simultaneously.

7) It offers a checksum for initial packet validation, thus minimizing
the CPU time required to discard a faulty packet. (Otherwise the
packet would have to traverse layers all the way up to TCP before
being validated.)

8) It also offers the ability to discard packets which aren't addressed
to the hardware address (call sign) of your station, again reducing
wasted CPU time.

It does more things as well, but that's a good start. AX25 plays the
same role over radio that MAC plays over ethernet. And for the same
reason, because they both use shared resources. If you are using a

non-contending point to point link, like a leased (or dial up after call setup is completed) phone line, or a duplex radio link on an exclusive frequency, then you don't need much of a MAC layer at all. But if you are sharing the channel with other stations, you must have something like AX25 to permit it to work.

VC mode, IE AX25 connected mode, basically duplicates the TCP transport function, and is usually just an undesirable overhead in a network where all switches support TCP/IP. It is of some use if intermediate relay sites can't comprehend TCP/IP routing and packets must be source routed between TCP/IP hosts. It is really just a kludge from the days when amateurs used no network or transport protocol and just depended on the horrible layer violation called AX25 connected mode as their transport layer, and did the network routing function by hand using source route statements in the digipeater fields. I'd suggest its use be avoided today.

>You're not limited to those two manufacturers. Onan, Kohler, and Dayton
>are other manufacturers.

And don't forget Yamaha and Kawasaki. Both are excellent, and a bit
cheaper than Honda. IMHO, Coleman generators are the bottom of the
barrel. Unfortunately, Onan, Kohler, and Dayton low end generators
are also bottom of the barrel. They *do* offer higher grade (and
heavier) models, though, while Coleman does not.

In my opinion, the three Japanese manufacturers offer better
portable generators than any of their US competition. They
offer better performance with less weight. This may be because
of their motorcycle experience. For heavier units, IE vehicle
or trailer mounted generators, Onan, and a few others, make some
good generators. But if I'm going to have to trailer mount a
generator, I want a diesel with more than 5 kW output. And
in that case, the best value on the market is the China Diesel.
They're crude, but they are also simple, rugged, and cheap.
They make up for lack of engineering finese by throwing more
cast iron at the problem. That works if you don't care how
much the thing weighs.

>73, Doyle KG6MY

The alternators on all the generators in this class are pretty much
the same, though there can be detail differences which may be important
in certain cases. What is really different is the engine, and the
frequency and voltage regulation systems. A real Honda brand generator
has all three covered. A Coleman with a Honda engine may not. (Even
Onan has had a problem with the voltage regulators on their otherwise
good 5 kW heavy RV package, and has changed regulator vendors three
times that I know about in the last 5 years.) Realize that Coleman
buys their engine from one source, their alternator from a second,
and their regulation circuitry from a third. All they do is package
these parts in a frame, IE the only thing Coleman about them is some
steel tubing.

Honda, Yamaha, and Kawasaki typically offer a better integrated
package with their name branded products. It's obvious that a Honda
engined Coleman is likely to be better than a B&S engined Coleman,
but it isn't quite as obvious if Coleman has integrated the total
package properly. In other words, you are likely getting a better
grade of junk with the Honda engined Coleman, but the total package
may still be junk because the parts may not have been carefully
matched to work together properly.

>
> 73 de Geoff, VA3FQA
> va3fqa@amsat.org

Sure, you can do this. Just use aluminum tubing either one size larger or one size smaller than the tubing to be spliced, IE the new piece can either be larger, and form a collar around the joint, or it can be smaller and serve as a plug inside the joint. Aluminum tubing is available in "telescoping" size steps, IE you can buy tubing whose ID is equal to another size tubing's OD, or vice versa. Just slip one inside the other (whichever way, I usually prefer the internal splice), and fix in place. The splice piece should extend several inches either side of the joint. (For large diameter tubing subject to high stress, the splice piece should extend a couple of feet either side of the joint to spread the mechanical stresses.)

There are a couple of ways to fix the pieces in place. One commonly used way is to slit the external piece(s) lengthwise for a couple inches and use stainless steel hose clamps to compress them down against the inner piece(s). Antenna manufacturers typically use this method when they need an element longer than a standard length piece of aluminum tubing. Another method is to simply use stainless self-tapping screws through the pieces in several places. Either method works, though the compression method will likely yield a better electrical connection.

Be sure to sand the surfaces to be mated bright, and coat with an anti-corrosive such as No-Al-Ox (available at electrical supply houses) before assembly.

> really pretty much "old hat" to those of us who work in industry ...
> it's only "exotic" and "newfangled" and "complicated" to those who
> haven't kept up with the times.

The systems for which he argues are not now available in the
market to my knowledge, as he implies in his comments.

Carl has been arguing for some time the merits of these "newer
digital technologies" over the "traditional" at least for now, CW
and SSB amateur communications modes. I believe there are
some very practical design constaints which still preclude their
realization in present, reasonably affordable amateur HF
band rigs. However, let me present my reasoning, and then
I am certainly open to further discussion on the matter.

Modern technology HF receiver design, even for the digital
techniques said to be much better than CW or other
older digital modes, such as the PACTORs, is still
dependent on some fundamental characteristics of
electronic circuits and devices.

The desired signal spectrum bandwidth establishes at
the outset the amount of noise energy (or voltage)
which must be handled somehow. This will lead
immediately to the signal-to-noise voltage or
information-to-noise ratio which must be detected

and demodulated. These requirements lead to the
classic HF receiver design problem of gain-bandwidth
and noise reduction/elimination.

The heterodyne technique, which came along in the
1920's (which has evolved into what we now
call superheterodyne techniques, and was actually a
copyrighted name by RCA in the later 20's) is , even
today, the most successful way to reduce the bandwidth
of the signal being amplified up to levels where it may be
successfully demodulated. The most costly new HF
receivers are using as many as four IF conversion frequencies,
with the final IF being centered in the 10 to 15kHz area
where audio frequency type DSP technology may be
applied. Here DSP technology can be used to further
reduce noise, and enhance coherent signal amplitude,
or extract deliberate non-coherent signals using, perhaps
IF frequency dispersive filter technology, providing
the "coding" scheme is known apriori, even should
these signals lie at negative signal-to-noise levels.
They will still "look" different enough to the circuits
to allow detection and demodulation. Unfortunately,
because of present component costs, audio frequency
type components with these characteristics are not
affordable for use in even a high-end price range amateur rig.

The signal frequency heterodyne technique is a way to attack the
gain-bandwidth and noise bandwidth problem in circuits (wires
with electrons bumping into one another within the conducting
material.) The flow of current, and thus information is NOT the
movement of electrons at light speed; it is the wave of
force of the electrons bumping into one another as a result of either
an applied voltage potential source at one end of the conductor,
or the passing, and thus amplitude-varying -with -time magnetic
field crossing the electron containing conductor. BTW, the finite
temperature of the conductor material will agitate the electrons
to also bump into one another a bit, and this adds noise voltage
into the circuit.

There is a fundamental physical principal which comes from thermo-
dynamics which says that noise amplitude is proportional to bandwidth,
conductor temperature and a constant of proportionality(which won't be
defended here) called Boltzman's Constant. This constant integrates
together a bunch of information about nature that has already been
established
as fact. Therefore, for an HF electromagnetic wave receiver to have
very weak signal sensitivity, the amount of noise in the receiver's
circuits must be brought as low as possible. In fact the lowest it can
become
would be exactly those microvolts or -dBm's that would be calculated
applying the above formula for the circuit temperature and signal band-

width of interest.

The heterodyne technique is still, at this time, the only way to
both add gain to a very weak received signal and to narrow the bandwidth
down to reduce the noise accompanying the signal, and also reduce
the noise introduced by the circuit electronics: this added circuit noise
is called Noise Figure of the gear and is usually only of much interest
at UHF and microwave frequencies. This is because there is a huge
amount of noise which accompanies signals in the HF bands from the
background emitters of the Galaxy, far more at the lower frequencies
than that added by the circuit electronics--this is why low noise preamps
are usually not used in HF gear, whereas above 100mHz or so, they
are very common. HF gear does often have an RF gain stage ahead
of the first IF stage mixer, but its purpose is not necessarily increased
sensitivity, but to reduce LO radiation back out the rcv'r front end which
could play hobbs with another receiver nearby, and to reduce the impact,
out of the desired IF passband , of nearby strong signals.

The most costly HF rigs today have up to four IF conversion used
frequencies, even going down to 10 to 15kHz IF center frequency:
here, as said above, modern DSP technology can be applied at IF,
rather than after detection and conversion to base band(audio
frequencies).

So the only way to have a very high sensitivity rig, is to have a unit
which can be tuned at will, all over the HF bands, and detect signals
using narrow bandwidths to lower the noise power which will
accompany the signals; this technique thus increases signal to noise ratio

amplitude.

Analog semiconductor technology does nothing about narrowing bandwidth
of circuits; in fact modern semiconductors have inherent very wide
bandwidth amplifying characteristics; just the opposite of what we want
in a very sensitive rig! The road to better rigs lies in the direction of
higher speed digital circuits; A to D and D to A converters. These will
allow
the DSP technology to be applied at higher than audio IF band center
frequencies, and should yield very sophisticated noise eliminating
techniques, as well as coherent and, when detected, non-coherent
signal enhancement.

This is the direction to newer traditional HF band receivers; I believe
this is the direction that new SOA digital modulation technology
receivers will also be going. Now, the cost's of the needed highest speed
digital components, frequency dispersive filters, etc., exceeds what
amateurs will pay--as a wild guess,$10 to $15 for a transceiver? Probably
way too high for a manufacturer to risk developing and marketing at this
time.

73, Jim, AH6NB (for a few more days, weeks?)

From Tad Cook, KT7H
Seattle, WA September 20, 1996
To all radio amateurs

SB PROP ARL ARLP039
ARLP039 Propagation de KT7H

Solar activity was down again last week. Average Solar Flux was down about a point, and average sunspot numbers were down about 3.7. Every day except September 12 had no visible sunspots.

The daily solar flux was below the 90 day average of 71 on each day over the past week.

Solar activity is expected to increase over this week, with solar flux to peak in the mid 70s around September 24 to16. Geomagnetic conditions are expected to peak around September 25 with A indices around 25 and K indices as high as 5. After October 1 solar flux should drop below 70. Geomagnetic conditions should get unstable again around October 7 to13.

The days are growing shorter, and the Fall Equinox will arrive September 22. Because of less daylight 20 meters is becoming more of a daylight band.

Sunspot Numbers for September 12 through 18 were 11, 0, 0, 0, 0, 0 and 0, with a mean of 1.6. 10.7 cm flux was 67.8, 67.3, 67.1, 66.4, 68, 69, and 68.9, with a mean of 67.8.

The Great South Bay ARC hosts ARRL amateur radio exams every 4th
Sunday at 12 noon. Please note the change for the month of June.
Re-scheduled because of Field Day and Father's Day.

Exams are given from Novice to Extra class.
All exams are ARRL/VEC, CW exams are multiple choice w/ full headphones.
The examination site is in the ARES/RACES room located in the basement.
Access is at the rear of the building via stairs. Ring RED (TOP) buzzer
for entry.

Location: Babylon Town Hall
Emergency Operations Center
200 E. Sunrise Hwy.
North Lindenhurst, NY

Talk in : 146.685/r 136.5pl

Please bring the following:
- Photocopy and original of current Amateur Radio License if licensed.
- Photocopy and original of CSCE(s) that are current.
- two forms of ID, at least one photo ID.
- pens or pencils.
- Calculator for math problems on exams, no pocket computers are allowed.
- 1996 Exam fee is $6.05, please bring exact change.
* Novice exams (elements 1A & 2) are free.

For addition information you may contact:

Continuous Wave (CW) modulation encoded by the International Code (not Morse, which was a different code largely used by landline telegraphy companies) wasn't introduced until after the turn of the century, and didn't see widespread use until after WWI.

If you're going to play historian, it might pay to learn some history first.

Not quite. The reason that SAC started using SSB was because hams began using it a few years after the war, and discovered it was heads and above AM. One of those hams was Curtis LeMay; after having used it himself, he ordered a ton of S-Line gear from Collins for SAC.

Congratulations, Carl. You've just repeated the most oft-cited ad hominem attack against CW. And in doing so, you've just (to mangle Yamamoto) awakened the giant and filled him with a terrible resolve.

No, CW is not outdated. Nor is the requirement. Newer technologies exist, but not in the Ham Radio domain, nor are they a cost effective replacement for CW, which nearly 90+ years after its introduction, is still the most spectrally efficient communications amateur technology in widespread use.

While I wholeheartedly agree that the required rates should be reduced, to eliminate them entirely would be an unmitigated disaster on the HF bands.

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 20/2330Z SEPTEMBER 1996 BY IPS RADIO AND SPACE SERVICES
FROM THE AUSTRALIAN SPACE FORECAST CENTRE
SUMMARY FOR 20 SEPTEMBER AND FORECAST FOR 21 SEPTEMBER - 23 SEPTEMBER

1A. SOLAR SUMMARY
Activity: Very low

Flares: None

Observed 10.7 cm flux/Equivalent Sunspot Number : 069/3

GOES satellite data for 19 Sep
Daily Proton Fluence >1 MeV: 3.3E+06
Daily Proton Fluence >10 MeV: 1.8E+04
Daily Electron Fluence >2 MeV: 9.7E+07 (normal)
X-ray background: A1.7
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
21 Sep 22 Sep 23 Sep
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 21 Sep: 070/5

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: Active

Estimated Indices : A K Observed A Index 19 Sep
Learmonth 25 4344 5433
Fredericksburg 31 12
Planetary 30 12

Observed Kp for 19 Sep: 1023 3432

2B. MAGNETIC FORECAST
Date Ap Conditions
21 Sep 20 Unsettled to active
22 Sep 15 Unsettled to active
23 Sep 20 Unsettled to active
COMMENT: IPS Geomagnetic Warning 10 was issued on 19 September
and is current for interval 23-26 September.

3A. GLOBAL HF PROPAGATION SUMMARY

Latitude Band
Date Low Middle High
20 Sep Fair-poor Normal Fair
PCA Event : None

3B. GLOBAL HF PROPAGATION FORECAST
Latitude Band
Date Low Middle High
21 Sep Fair-poor Normal Fair
22 Sep Fair-poor Normal Fair
23 Sep Fair-poor Normal Fair

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Date T index
20 Sep -7

Observed Australian Regional MUFs:
Darwin: 15-30% depressed for the period 0000-0900UT,
otherwise near predicted monthly values.
Townsville and Sydney: Near predicted monthly values.
Hobart: 15-30% depressed for the period 0000-1300UT.

Predicted Monthly T index for September: 9

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
Date T index MUFs
21 Sep -5 Depressed 10-30% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.
22 Sep -5 Depressed 10-30% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.
23 Sep -5 Depressed 10-30% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.

Our ham radio group, the South Jersey Radio Association, is planning on conducting a Novice/Tech-Plus class this fall and winter. I wonder if any hams out there are aware of or have used any shareware for code instruction and practice. We have a number of programs available, but they are not considered shareware. We would like to make copies on disk to give to each class member to study code our their own.

Any comments? Please reply here on the newsgroup.

I own two units which are hybrid sold by Coleman. 5kw peak with *Honda*
engines and alternators, the rest is Coleman. I have had good service
and they are pretty quiet also. about $1100.

_/ _/_/ _/_/ _/ _/ _/ _/ _/
_/ _/ _/ _/_/_/ _/ _/ _/ _/
-
Here is a summary of news items covered on edition #182 of
"This Week in Amateur Radio", North America's satellite-delivered
audio bulletin service, for the week ending 27-Sep:
-
1. Three More Hams in Space, One to Stay Four Months Aboard Mir
2. AMSAT Discusses Cosmonaut Activity Schedule, When to Work Them
3. FCC Says Electronic Version of Vanity Call Sign Form Available
4. AMSAT-France Member Wins International Engineering Award
5. "Ancient Amateur Archives" w/Bill Continelli, AB2CA (ex-KE2XB)
6. Weekly Propagation Forecast
7. "Gateway 160 Meter Net Report" with Vern Jackson, WA0RCR
8. UNAMSAT Team Returns to Mexico City, Satellite Check-out Begins
9. Special Event Station Calendar
10. Former AMSAT-NA President Suffers Heart Attack, WA2LQQ SK at 52
11. "The RAIN Dial-up" from Chicago
-
Funding for the program's transmission and production expense was
provided this week by a grant from Mike Reynolds, W0KIE, of Tulsa,
Oklahoma, and the W0KIE Satellite Network, which carries "This Week
in Amateur Radio" to affiliates throughout North America.
-
"This Week in Amateur Radio" is a weekly amateur voice bulletin
service, produced by Community Video Associates, Inc., a New York
State not-for-profit corporation based in Albany, NY. The program
is heard on the "W0KIE Satellite Network" each Saturday at 9:00 PM
(EDT) on the Hughes Communications SBS-6 commercial communications
satellite, transponder 13B upper, located at 74 degrees west
longitude in equatorial geosynchronous orbit. The transponder
center frequency is 12.019 GHz; tune up in frequency to 12.031 GHz.
Program audio is on the 6.2 MHz analog subcarrier and carried on
VHF/UHF repeaters throughout North America and on 160 meters at 1860
kHz. Contact your local amateur radio club or repeater operator if
"This Week in Amateur Radio" is not being heard in your area.
-
Production and transmission expenses are underwritten by donations
from repeater operators, amateur radio clubs, and individuals.
Further information is available from George Bowen, N2LQS, at
518/283-3665 (email kxkvi@delphi.com) or Stephan Anderman, WA3RKB,
```

at 518/664-6809 (email sanderman@delphi.com). You may also reach
them @ WA2UMX.FN32AW.ENY.NY.USA.NA via amateur packet.

*** Mid Atlantic VHF Conference ***

The 20th Annual Mid-Atlantic States VHF Conference sponsored by the Mt. Airy VHF Radio Club will be held on Saturday, 5 October at the Days Inn in Horsham PA. Technical presentations relating to VHF/UHF/SHF weak signal operating will begin at 9AM.

The Days Inn is located just north of exit 27 (Willow Grove exit) of the PA Turnpike, just north of Philadelphia, in Horsham, PA. Rooms at the Days Inn can be reserved by calling 215-674-2500. Mention Pack Rats for a discount. The Days Inn is filling up quickly, so reserve soon. Additional lodging is available in the Horsham area: Holiday Inn Trevose (215) 364-2000, Marriott Willow Grove (215) 830-0550, Hampton Inn Willow Grove (215) 659 - 3535, Warrington Inn (215) 343-0373.

*** HAMARAMA ***

On the following day, Sunday 6 Oct. the Packrats will have their annual hamfest at the Bucks County Drive In Theater, about 5 miles north of PA Tpk. exit 27 on Rte. 611. Talk-in on 146.52 simplex and the club repeater on 224.58.

Ron, WZ1V has placed the flyer for the events, including a preliminary list of presentations, on the N.E.W.S. Group web page:
http://uhavax.hartford.edu/~newsvhf/hamarama.html

For more information on the technical conference or a possible presentation slot, contact John Sortor, KB3XG, at 610-584-2489 or at JohnKB3XG@aol.com.

** Preliminary Conference Agenda **

SPEAKERS TOPICS

KD1DU, Del Schier - Introduction to 10 GHz Equipment and Operation

WB6JJN, Jim -Amateur Satellites:Modes, Bands,& Issues @ VHF thru Microwaves

AJ3K, Jim Rautio, Sonnet Software - 3-D Planer Electromagnetic Design

WA1YHO, Gary Dallas - Using YO & AO to Optimize a 6M Antenna System

N1DPM -Introduction to VHF/UHF Weak Signal Operating

Harvey Kaylie, Mini-Circuits Laboratories

WB2SON, Richard Fiore - American Technical Ceramics

W3ZZ, Gene Zimmerman - 40 Years of Contesting

Preliminary schedule of events:

Friday, October 4, 1996
5pm to 11pm - Out of town guests arrive, check in.
The 2 meeting rooms be used as a hospitality suite. The Pack Rats will provide snacks & beverages

Saturday, October 5, 1996

9am to 12pm Morning conference session.
12pm to 1pm Lunch break
1pm to 5pm Afternoon conference session.
5pm to 7pm Hospitality suite.
7pm to 9pm Dinner/Banquet
9pm to 11pm Hospitality suite.

Sunday, October 6, 1996

6am to 10am Check out
7am to 3pm Hamarama at the Bucks County Drive In

73!

Even though I maintain this site at my house, with my own funds,
completely pay for my link myself, and in no way represent my employer
at all in any online posting, I have **STILL** had people (not you, in case
anyone gets the misconception) physically call my employer and complain
about my posts.

Just this morning, as a matter of fact.

You can quote sales figures of parts being sold but you can't conclude
the projects those components are supposed to go into are ever completed
or even started. Sales of parts doesn't give a very accurate account of
homebrewing. But, hearing comments of what folks are building naturally
enough does gives an account of the general trend in homebrewing.

Now, I think we're going to have to redefine "homebrewing" - I've got
an article here from QEX titled The Ultimate VFO (April 1996); the
circuit contains two major ICs, a clock module, a handful of resistors,
and a few push-button switches. Is snapping ICs into sockets considered
homebrew? I'll say "no", and call something like this a kit, instead.
I'll snap it together but won't make any claim that I homebrewed a
VFO. I've homebrewed VFOs before from scratch and this project won't
begin to come close to the detailed work that those necessitated. And
it won't be as rewarding, either.

From: Bill <bsplaine@sonic.net>
Message-ID: <32436CC0.27A2@sonic.net>
Source record: 216421

I'd like to figure out a sanitary installation of a dual bander with removable head on my Ultraglide. I have one on the Goldwing I am getting rid of but can't for the life of me picture a good place to locate the head..... does anyone in cyberland know of a ham with a rig mounted on a Harley???? Other than the 'fancy' fairing on the Ultraglide, they are probably about all the same. I am not necessarily interested in making it work in conjunction with the sound system on the Harley as I did with the Goldwing... just a nice setup...

Thanks for any help on this or putting me in contact with someone...

I seem to be the one who Henry Churchyards the rule "how they spell it
and/or how they pronounce it is ALWAY CORRECT".

Truckers pronounce it Kay-Beck; hearing kay-beck said in a Bubba
accent speaks volumes about the way the language is actually spoken.
My observation is that when Bubba says kay-beck and when Jean-Marie
says kay-beck, then, it's kay-beck. We have cross-dialectal
confirmation of the *standard* pronunciation.

Now. As to the *actual* Quebecois (i.e., French-Canadian)
pronunciation of "Quebec": I'm not sure. It's somewhere between
/keI'bEk/ and /kE'bek/, with a compromise /k@'bEk/ thrown in. I'd like
to hear from a primarily francophone Quebecois for confirmation or
refutation.

--
Mark Odegard odegard@ptel.net
The great orthographical contest has long subsisted between
etymology and pronunciation. It has been demanded, on one hand,
that men should write as they speak; but, as it has been shown
that this conformity never was attained in any language, and
that it is not more easy to persuade men to agree exactly in
speaking than in writing, it may be asked, with equal propriety,
why men do not rather speak as they write.
-- Samuel Johnson, "The Plan of an English Dictionary" (1747).

>on top of the aging ALOHA.

I tend to agree with this. My opinion is that the 'no business
' rule on ham radio is overly stringently defined. I don't
want to see commercial businesses on the ham bands, but I think
some lightening up would allow us to do more cool stuff.
I've heard so much anal retentive rules lawyering on ham radio
to make me comatose.

>We need the equivalent of the IBM to generate and build
>universal standars and hardware and we need the equivalent
>of Microsoft to help us be better users of the system.

I see the lack of standards and of cool new stuff as an
opportunity more than a problem. I think the problem is
more organizational. If you do a new communication technology
you need more people doing it. Know what I mean? Who wants
to build a 110K baud packet if there's no one else to talk to.

Most exotic ham radio technology has to take place on microwaves
where the bandwidth is, so it's even more important to have
a buddy close by who you can work with. I don't think it takes
that many. I guess if you have 4 or 5 people doing say, ATV or
high speed packet in an area once a week, then you could get
others to start building boards.

I'm not an expert on what it takes on the radio side, but it seems
to me that the problem is mainly getting the bandwidth. If we
had a transciever that was pretty much like any other box we have
now, but could transmit signals of higher bandwidth, wouldn't that
provide a bedrock for all kinds of interesting experimentation.

Some of the things I've proposed were ideas that I made up as I wrote
the posts like the "digital CW" system ... it's doable ... but only hams
would WANT to do it ...

Some of the things I've mentioned are in current use in the commercial
or military arenas ...

Everything I've proposed or alluded to is doable with technology that we
have today ... no real breakthroughs are necessary, just some good solid
design work ...

> I believe there are
>some very practical design constaints which still preclude their
>realization in present, reasonably affordable amateur HF
>band rigs.

I disagree ... and since when were amateur HF rigs (using current
technologies) cheap?

>However, let me present my reasoning, and then
>I am certainly open to further discussion on the matter.
>

>Modern technology HF receiver design, even for the digital
>techniques said to be much better than CW or other
>older digital modes, such as the PACTORs, is still

Yup ...

{snipped a bit of non-essential stuff that didn't make a lot of point}

>The heterodyne technique, which came along in the
>1920's (which has evolved into what we now
>call superheterodyne techniques, and was actually a
>copyrighted name by RCA in the later 20's) is , even
>today, the most successful way to reduce the bandwidth
>of the signal being amplified up to levels where it may be

>successfully demodulated.

Superhets are being replaced with newer techniques such as
direct-to-baseband I/Q demodulation and DSP or sampling at IF and doing
the demod (and the mod in transmitters) in the digital domain with DSPs.

>The most costly new HF
>receivers are using as many as four IF conversion frequencies,
>with the final IF being centered in the 10 to 15kHz area
>where audio frequency type DSP technology may be
>applied.

Multiple IFs cause spurious problems, increase costs, and are being
replaced with more advanced techniques.

Low IFs in the audio range at the end of a multiple-conversion superhet
is a pretty gross way to design a radio.

DSP only at audio (filtering, etc.) is NOT a "DSP radio" ... it's a
bandaid ... a "real" DSP radio will do the mod and demod in the digital
domain ... (yes for FM and SSB, too ... my patents cover EXACTLY that,
so I know of what I speak ... and the trend in modern radio transceiver
design is definitely in that direction ...)

>Here DSP technology can be used to further
>reduce noise, and enhance coherent signal amplitude,
>or extract deliberate non-coherent signals using, perhaps
>IF frequency dispersive filter technology, providing
>the "coding" scheme is known apriori, even should
>these signals lie at negative signal-to-noise levels.
>They will still "look" different enough to the circuits
>to allow detection and demodulation. Unfortunately,
>because of present component costs, audio frequency
>type components with these characteristics are not
>affordable for use in even a high-end price range amateur rig.

Huh????? A DSP subsystem is going to be a hell of a lot cheaper than
all those crystal filters and jacking signals around from one IF to
another, etc. ... the "rice box" people just haven't figured out how to
do it yet ... (or maybe, they just fugure they have no incentive to
invest in designing modern stuff for people who still insist on using CW
..)

[snipped out some sort of basically correct, but confusingly-worded
stuff about Boltzman's Constant and the fact that thermal noise exists]

>The heterodyne technique is still, at this time, the only way to
>both add gain to a very weak received signal and to narrow the bandwidth
>down to reduce the noise accompanying the signal,

Horse-puckey ... the 900MHz spread spectrum system I'm currently
building at work does an I/Q mix DIRECTLY to baseband from 900 MHz,
digitizes the I/Q signals and does everything else digitally.

It would appear that you've been consulting the outdated works at
the local public library???

Yes, some of us know about noise figure, too ...

>
>The most costly HF rigs today have up to four IF conversion used
>frequencies, even going down to 10 to 15kHz IF center frequency:
>here, as said above, modern DSP technology can be applied at IF,
>rather than after detection and conversion to base band(audio
>frequencies).
>

Boy did they see you guys coming (ha, ha) ... ("Wow," he says ... "this
one has FOUR IFs!!! This *must* be *better* than that one ... it only
has THREE!)

Didn't your mama ever tell you the story about the "three little spurs"
??? (or was that three "bears"??? <snicker>)

>So the only way to have a very high sensitivity rig, is to have a unit
>which can be tuned at will, all over the HF bands, and detect signals
>using narrow bandwidths to lower the noise power which will
>accompany the signals; this technique thus increases signal to noise
>ratio amplitude.
>

In a "homodyne" ("direct conversion") receiver, all that needs to be
tuned is the LO ... in the case of an I/Q mix to baseband, it's exactly
the same frequency of the carrier frequency of the signal you wish to
tune ...

>the DSP technology to be applied at higher than audio IF band center
>frequencies, and should yield very sophisticated noise eliminating
>techniques, as well as coherent and, when detected, non-coherent
>signal enhancement.
>

DSP can be applied either at baseband, after the afore-mentioned I/Q mix
from RF to baseband, or, as I said before the IF can be sampled
directly. And NO, Virginia, one does NOT have to have a 900
megasample/sec plus A/D converter to sample an IF signal at 450MHz ...
there are other ways of satisfying the revered Mr. Nyquist ...

>This is the direction to newer traditional HF band receivers; I believe
>this is the direction that new SOA digital modulation technology
>receivers will also be going. Now, the cost's of the needed highest speed
>digital components, frequency dispersive filters, etc., exceeds what
>amateurs will pay--as a wild guess,$10 to $15 for a transceiver? Probably
>way too high for a manufacturer to risk developing and marketing at this
>time.
>

Agreed that many hams think prices are too high ... but they're getting suckered into paying big bucks for those 3-4 conversion "super"hets and "DSP" radios that really just use the DSP for some fairly basic audio filtering ...

But "Buzz-words" sell radios to people that don't know the difference, I guess.

On another topic ...
I've been accused recently of wanting a no-code license to "line my pockets" because I (allegedly) work for a company that' "waiting in the wings to get rich selling it's HF stuff to all the new no-code hams"
..

As I said before ... the company I presently work for would not waste 10 picoseconds of its time even thinking about the ham market ... I'd bet that we spend more on R&D alone in a month than most ham manufacturers make in an entire year ...

I have not one iota of financial interest, either personally, or through my employer, in the code/no-code issue ...

Whether CW is an "art form" is subjective at best. One could argue that anything from a good construction to a video broadcast is also "art".

I see that you are proud of you abilities on CW and phone, yet there is no exam on phone. It is obvious from your text that your phone abilities increased, as well as your CW abilities. This is personal dedication and is obviously not linked to a single exam.

Yes, it may be true that if the Morse exam is removed that there would be more people on HF initially without Morse knowledge, but I doubt it would be true that percentage of amateurs using Morse after being licenced, say, 5+ years would be any different. If you are interested in Morse you will learn it. Taking the position that people must learn Morse to get an interest can surely be applied to ANY amateur activity. People who have a passion for something can never understand why others don't have the same appreciation, yet I don't anyone would support examinations in every possible mode just so that we can appreciate them.

> and you will try and protect it.

Again there are very few who advocate the removal of CW from any bands. I certainly don't. The amateur bands are for every mode. Having "real pride in your hobby" is a personal experience and it is unwise to think that one's own activities are what makes everyone else proud.

> Because I am an Extra does that make me elite? Well, it took me 20

> I'm elite, just proud of what I did. Do I deserve more spectrum--you
> bet--I earned it! You earn it, and don't degrade the accomplishments of
> others.

Interesting that you believe that questioning the continued relevance of an exam is degrading your accomplishments in Amateur Radio. Surely, your personal sense of achievement can never be affected what happens now. I can remember having a geat sense of pride when I first started work (with 1kW valve transmitters left over from WWII). The fact I now work with solid state transmitters putting out hundreds of kW does not lessen the value of that achievement to me. Achievments can never be taken away from you, if YOU believe that they were real achievements.

The licence examination should examine what people are REQUIRED to know and continue to do, long AFTER the examination has finished. This is the case for the theory and regulations as there are penalties for non-compliance. This doesn't mean that you can't or won't forget, but it does mean that ignorance cannot be used as an excuse for a breach. The same does not apply to the Morse exam, so it isn't a suitable topic for a LICENCE exam.

I only speak of LICENCE exams and what they should do, not "achievement" awards which AR may issue to operators and experimenters.

We learned about 10 days ago of a proposed new law in the State of Washington that would have required certification of all mobile radio installations by the State Patrol. We contacted the State Patrol and our state representative, Brian Thomas. As a result, the proposed draft has been thrown out and the scheduled public hearing on the matter has been cancelled. Today the State Patrol has advised us of new wording for the proposed rule - wording that no longer appears to have an impact on Amateur Radio operations. You can read the complete story in an EXCLUSIVE story published at Ham Radio Online at http://www.hamradio-online.com

>How much "knowledge" is needed by CB folks to safely operate their
>radios.

Obviously, from the harmful interference complaints against them, over half a million a year according to the FCC, considerably more knowledge than they currently exhibit. And from the reports of accidental contact with power lines when erecting CB antennas (such a problem that CB base antennas all come with warning stickers now), more than they have exhibited.

>Now, granted, the power limits are a little different, but the same
>general concepts apply.

Yes, the power limit is different, and those who obey that limit aren't too likely to suffer a biohazard from RF exposure, as contrasted to amateur operators who are allowed power limits which can be hazardous (to themselves and to others). And the radios are Type Accepted, so there's less chance of emissions outside their allocated spectrum to cause harm to others if they leave the radios unmodified, but that doesn't apply to amateurs either.

If amateurs were limited to 5 watts, and required to use unmodified Type Accepted radios, considerably relaxed examination standards could be permitted. But that is not the case, and I would suggest it would be an extremely undesirable course for amateur regulation to take. That's because it is counter to the primary purpose of the amateur service, that of technical investigation.

And note that a Morse speed test doesn't address any of these concerns. It doesn't address an amateur's knowledge of RF biohazards. It doesn't address an amateur's knowledge of spurious emission suppression. It doesn't address an amateur's knowledge of basic electrical safety. Etc. It merely measures Morse speed, something that the lack of calls for enforcement action against those who send Morse slowly or poorly on the amateur bands has clearly demonstrated to be a non-problem.

The problems of concern in amateur radio don't appear to be related to Morse speed at all. In fact, enforcement records would seem to indicate that enforcement actions against amateurs fall disproportionately against those who have passed the highest speed Morse exam, IE Extras, who comprise the smallest amateur class, have the largest percentage by class of NALs filed against them.

Now while correlation doesn't prove causation, it certainly raises a suspicion that there is some sort of link. Since there are no reported enforcement actions against use of too low (or too high) Morse speeds, the link cannot be a direct one. However, in as far as a Morse speed exam may inadvertently measure behavioral factors, it would appear to select disproportionately for those whose behavior is deemed unacceptable.

To be charitable (and fair), it would appear that most violations are not for actions in which Morse usage is directly involved. This would seem to indicate that the behavioral selection (if any) which is occurring is among that group who see the Morse speed exam as a "challenge" to be overcome rather than among those who see Morse as a utilitarian tool.

This may be indicative of persons lacking a strong internal set of values, IE persons who must have some external sort of validation of their self-worth to hang on the wall as proof that they are more than they *really* subconsciously believe that they are. This sort of behavior is often an indicator of deep seated personality problems.

>No, AX25 serves a real purpose. It forms the MAC (Media Access Control)
>layer for the upper layers. Here are some of the things it does.

I'll re-order these slightly, though keep the same numbers:

>1) It provides the CS part of CSMA by holding off transmission when
> another carrier is sensed on the channel.
>
>3) It provides the Txd to handle transmitter and receiver settling times.
>
>4) It provides a way to avoid repeated collisions through its p-persist
> and slottime parameters.

But these are channel-access issues; the radios and low-level
interfaces deal with this. At this point, the packet is yet
another bag-o-bits to squeeze out the radio and nothing more.

>2) It provides the leading flags needed to synchronize the HDLC clocks.
>
>7) It offers a checksum for initial packet validation, thus minimizing
> the CPU time required to discard a faulty packet. (Otherwise the
> packet would have to traverse layers all the way up to TCP before

>
>8) It also offers the ability to discard packets which aren't addressed
> to the hardware address (call sign) of your station, again reducing
> wasted CPU time.

Technically, I suppose this is correct since the AX.25 specifications go
on about HDLC and the sort. But HDLC is almost a channel thing too --
just another way of recognizing that a packet is there.

>5) It provides the hardware addresses in its header to which logical
> IP addresses are mapped (via ARP). (Hardware and logical addresses
> must be separate if multiple protocols are to be supported.)
>
>6) Its PID byte allows multiple higher level protocols to co-exist
> to/from the same hosts, simultaneously.

When you get down to it, this is really *all* that wrapping an AX.25 envelope
around IP packets does.

Well, that, and in the United States, keeping millions of hams out of jail. :-)

>[VC mode] [...] I'd suggest its use be avoided today.

I'd go farther and suggest that use of UI AX.25 frames ought to be avoided. This because the UI frames are not acknowledged or re-transmitted, etc, one is implicitly depending on the higher level protocols (eg, TCP) to perform these functions.

This is a mistake, as anyone who has tried to run TCP over a non-outstanding AX.25 radio link knows all too well -- TCP stands a good chance of backing off to infinity or two minutes (whichever is shorter), and throughput drops to almost zero. This is not a bug in TCP, but rather a TCP design feature (good behaviour on congested networks) that conflicts badly with typical amateur radio reality.

[Actually, it is not limited to amateur radio -- other wireless networks suffer the same problem. For one proposed, but alas not too useful, solution to this call up altavista and do a search on "Snoop Protocol".]

IMHO what is needed is a new link-layer that provides:

a) items (5) and (6), given above.

b) non-connectionless, low-overhead, frame retransmission

c) some measure of FEC to keep (b) from being invoked often.

d) anti-HTS -- how many more years must the chaos continue??

e) slim-and-trim headers -- bit-hack to the extreme (though within reason), so the protocol can be used relatively painlessly on on both slow-speed and very high-speed channels.

and maybe,

f) zlib data compression (dictionary generation/selection would be an interesting problem).

Since this here newsgroup is intended as a forum on miscellaneous digital issues in amateur radio, perhaps some discussion on this will ensue?

>The systems for which he argues are not now available in the
>market to my knowledge, as he implies in his comments.

Certainly the ultimate extensions of the techniques Carl
expouses aren't currently available on the amateur market.
That's what makes them attractive targets for the experimenter.
However, there are systems employing the principles of which
he speaks available today which already offer advantages over
conventional analog technique.

Analog technique is throughly plowed ground, and aside from
improvements in device intrinsic properties, which amateurs
are unlikely to be equipped to forward, there is little new
or innovative the amateur can bring to that table.

Digital techniques are new enough (to practice, theory is well
plowed) that not all the ground has yet been plowed, and device
intrinsics are already good enough to allow exploitation beyond
that demonstrated in commercial work to date, and those intrinsics
are rapidly improving too. This is thus fertile ground for the
experimenter to exploit. New and innovative signal designs and

codings are within amateur reach to develop as well. The amateur
is uniquely situated to exploit these techniques because he
has at his disposal a testing laboratory far better than any
bench environment in which commercial developers have to work.
That's the harsh on air environment of the HF amateur bands.
(Though there are some pesky regulatory problems due to historical
artifacts in the thinking of the regulators and the current
amateur population.)

The principle factor of concern here is *dynamic range* and
freedom from cross modulation. The naive SNR is of little
concern, operation well below the naive SNR has been amply
demonstrated, even among amateurs. The real thing of concern
is Eb/No, and that's an entirely different matter for signal
designs exploiting properties other than mere brute force
amplitude differences between signal and noise.

Lets look at why superhetrodyne technique is useful, and why multiple conversion steps are often used. Superhetrodyne technique allows high levels of RF amplification without requiring tracking tuned circuits over a broad spectrum. In other words, an alternative to superhetrodyne technique, the TRF receiver, requires each gain stage to have track tuned LC components while the IF of the superhet can use fixed tuned LC components. This lowers costs and simplifies design. (Or at least it did in the discrete component era.)

Stablility is another concern addressed by superhetrodyne technique. By breaking up the gain blocks into different frequency sets, feedback from input to output becomes a much lessened problem. Instead of having to isolate the input from the output by 120 db, isolations of 40 db are often sufficient to prevent regeneration to the extent of breaking into spurious oscillations. This lowers costs and simplifies design. (Or at least it did in the discrete component era.)

Conventional superhetrodyne receivers depend on rectangular filtering for selectivity. Not only is this non-optimum from the standpoint of Eb/No (much more on this later), but it is also difficult to practically be made adaptive in mere width. So modern superhets often use multiple conversion stages in order to implement PBT and IF shift. These techniques allow one to slide the rectangular windows of the individual IF filters across one another to achieve variable bandwidth. This is a useful trick, and allows deletion of multiple expensive fixed bandwidth filters at the cost of increased circuit complexity and increased susceptability to birdies.

Another issue the superhet has to deal with is images. In the mixing process needed to achieve superhet designs, each mix produces the desired signal, and an image displaced from it by twice the IF frequency. If the IF is low, the image will be nearby to the desired signal, and will leak through. This degrades the naive SNR as well as allowing interference sources through. Therefore a high IF is desirable because it displaces the image far from the signal and allows simple preselector filtering to be used to suppress it. In fact, modern HF receivers often use an IF of a higher frequency than the desired signal (up conversion) to avoid the image problem, and to allow continous tuning without a gap at the IF frequency. For cost reasons in obtaining rectangular IF selectivity, and to allow PBT/IF shift, multiple down conversions

then follow the first IF.

Quite a number of the superhet's defects are the result of the hetrodyne process itself (birdies, images, complexity, and cost), and the dependence on rectangular filtering to set the naive SNR. If we didn't have to depend on rectangular filtering, and we could deal with the feedback potential of high gain amplification, we would drop the superhetrodyne technique in a heartbeat.

One amateur technique used to avoid the superhet's defects is the direct conversion receiver. Modern ICs have allowed us to avoid most of the stability problems which plagued earlier attempts to have high gain in a single gain block, and a complex active lowpass filter can give us rectangular selectivity. The image frequency of a direct conversion receiver is very low, however, actually in the desired passband range, and prohibits "single signal" reception while costing us 3 db in naive SNR.

With today's intrinsics, the 3 db naive SNR reduction would be of little concern if we only faced a gaussian noise environment. But we don't at HF, so "single signal" selectivity is desired. Thus enters the modern quadrature (or I/Q) receiver design exemplified in amateur practice by Rick Campbell. The R2 applies phase quadrature technique to the direct conversion receiver and allows "single signal" reception while also eliminating the 3 db gaussian noise penalty. This same I/Q technique is embedded in several modern communications IC sets designed for SS and other digital reception tasks.

Note that the "baseband" emitted by the I/Q receiver can also be considered merely a very low first IF with image suppressed. Thus DSP processing of this signal is actually first IF processing, something which can't yet be practically achieved in more conventional superhet designs (though more on that below as well). Thus a simple, cheap, and very high performance DSP based receiver can be built this way.

Even higher performance can be obtained by discarding the analog I/Q combiner at the output of the R2 and using DSP directly on the I and Q signals. This offers a number of very powerful advantages for complex signal designs. This is very close to digital processing of the on-frequency signal in situ.

There is an even closer way to doing on-frequency in situ digital signal processing. This technique takes advantage of the aliasing inherent in the digital sampling process. By using an available flash A/D converter, direct sampling of the desired signal in situ is possible. The sampling rate only has to be twice the signal *modulation* frequency, and not twice the signal frequency, though the sample *width* has to be 1/(2*f) the signal frequency, a condition easily

met with the flash A/D converter. This aliases the signal
modulation down to baseband where it can be processed by
a conventional DSP. No exotic very high cycle rate DSP
chip is required.

There remains only one problem. That is *dynamic range*.
The analog front end of the superhet, the direct conversion
receiver mixer, the I/Q receiver mixer, and the flash A/D of
the sampling reciever all have to be able to handle the dynamic
range of signals received off the air. Because of the non-
linearity of the high gain blocks in analog superhet receivers,
AGC has traditionally been applied as a way of dealing with the
dynamic range of the signals present on the air. This is a
very unsatisfactory solution for receiving weak signals in
the presence of strong interfering signals.

The equivalent of analog gain blocks in the digital domain
is numerical multiplication of the signal samples by a fixed
gain constant. This is completely linear as long as the multiplier
does not overflow. That can be assured by using a sufficient number
of bits to contain the expected dynamic range. To handle the dynamic
range of off the air signals at HF, 24 bits are required. So a 32
bit DSP can safely handle the required dynamic range if care is taken
with processing algorithms to prevent overflow and underflow during
calculations, IE arbitrary precision math routines which treat the
operations piecewise. Some of the newer 64 bit DSPs make this an
almost trivial process by allowing near native integer math
calculations (that's better because it is much faster).

Ok, all of this is fine and good, but it implicitly assumes that the
only form of selectivity is rectangular filtering. That's not the
case when we can bring more powerful processing techniques to bear.
Signal design theory tells us the ideal filter is the perfectly matched
filter, or equivalently the perfect correlator. Now the shape of a
matched filter is almost certainly never rectangular. The shape has
to match the signal phase and amplitude response *precisely* at every
instant in time (note this implies a coherent signal design is mandatory).
With good signal design, this complex shape is very different from the
rectangular filter response of analog receivers, and passes a very
different noise distribution from gaussian. This sort of filter
yields Eb/No rather than a naive SNR. Now such matched filters are
possible to implement in DSP, but they can be very computationally
intense. Signal theory tells us correlation can give an equivalent
result, and correlation is usually much less computationally intense
to implement, so that's the favored technique.

A well correlated signal can have a naive SNR in a rectangular bandwidth
of -18 db or worse while still exhibiting an Eb/No of +10 db or better.
That's because the complex shape of the equivalent matched filter allows
in less gaussian noise with the signal than a naive rectangular filter
of occupied spectral width. Thus traditional naive SNR statements don't
have much meaning when applied to correlated complex digital signals.

I haven't yet addressed the additional "gains" possible from error
correcting codings. If parts of the signal are above the detection
threshold set above, the entire signal content can often be obtained
by use of FEC techniques. This isn't precisely a detection gain
because at least parts of the signal must be detectable without
it, but it certainly represents a throughput gain.

>amplitude.

As noted above, there are other ways of getting to a sample rate
that current DSP can handle than the multiple conversion superhet.
Thanks to improved device intrinsics, this is likely to become
the favored approach, and multiple conversion superhets are likely
to become dinosaurs.

>digital components, frequency dispersive filters, etc., exceeds what
>amateurs will pay--as a wild guess,$10 to $15 for a transceiver? Probably
>way too high for a manufacturer to risk developing and marketing at this
>time.

That's a shocking statement, but it may be true. $10-$15 extra
may be more than amateurs are willing to pay for better performance
equipment, especially if it means abandoning their "traditional"
signal modulations. But I expect that the RF part of tommorrow's
receivers will actually be simpler than today's receivers, and
should offer markedly reduced costs. The digital back end will
add costs, but probably not enough to offset the up front savings.
(The price of digital components continues to plunge as their
power grows while the cost of analog RF components continues
to soar.)

Note, transmitter costs and complexity are essentially moot.
Off the shelf technology already allows us to build suitable
I/Q transmitters at low cost and with sufficient performance.
(An I/Q transmitter allows us to generate any arbitrary signal

design.) It is the receiver, and suitable signal design, which
are the keys to big performance gains.

>KH2PZ

Why am I not surprised? Aloha is a channel sharing technique first developed by ARPA in the 1970s, and is used in VHF amateur packet networks. Aloha is a simple technique to implement, but offers only 20% of a fully loaded channel's capacity before congestive collapse sets in. It is thus well suited to simple low loading networks, but fails when network loading increases above the critical threshold.

For years, amateur packet channels had light enough loading that Aloha was sufficient. But today the load factors are higher, and a better method is required. Aloha assumes a network of hidden terminals communicating through an exposed node terminal, IE a digipeater. To move past the Aloha limit, hidden terminals must be made visible by the network. Digital repeaters can serve this purpose. This allows the CS in CSMA to work on the LAN, thus reducing collisions, and increasing channel throughput.

There are other sharing strategies, for example token passing, round robin (also known as slotted Aloha), etc, which could be used. But the other techniques have problems for ad hoc networks. Aloha networks are simple to join and leave. Digital repeater based LANs share that attribute while not suffering from the congestive collapse limit of pure Aloha.

I am contemplating a move to the Antelope Valley
(Palmdale/Lancaster, CA) and am also considering purchasing a new
handheld, but don't know whether to buy a 2m or a 2m/440
dual-bander.

On which bands are the active repeaters in that area?

Also, does anyone have e-mail or snail-mail addresses for any
amateur radio clubs in that area?

Thanks.

To which, I now write: The highest priced HF rigs on the market today
from
Japan, -- ICOM IC-775; Yaesu FT-1000MP, and the
Kenwood TS-870S -- all use IF DSP in the final IF stage at 10 to 20 kHz
range. One can order from the ARRL labs VERY detailed technical test
reports about these; running to 25 pages and more of data. Have a close
look at the data, then listen to the users on the HF bands; then comment
about whether or not these applied technologies now being sold are
effective when compared with rigs on the market just 2 years ago.

Some of the Big Gun contest types, eg John Devoldre, ON4UN, have
sold their "stable" of Yaesu FT-1000D's (the alleged best amateur HF
rig of the immediate past years) and replaced them with FT-1000MP's
on each of the principal HF bands! Of course John also has multiple 150'+
towers, etc, megabucks into his Super Station. He has worked 245
countries on 160 meters, and has 343 confirmed on 80 meters! So
he knows low band HF technology and what works, and what is
better when it comes along. Cost is NOT an issue for him, and many
others. John obviously compares to those who own and use a
stable of Ferrari automobiles; not many of us can do that.

I also wrote:

That the sort of components to which Carl and others have
alluded in their postings

>" Horse-puckey ... the 900MHz spread spectrum system I'm currently
> building at work does an I/Q mix DIRECTLY to baseband from 900 MHz,
> digitizes the I/Q signals and does everything else digitally."

Now we ARE down to it!

Carl. what is the spectrum bandwidth of your spread spectrum signal,
(if it isn't classified) and what is the basdband width of information
after you have I/Q mixed to baseband (which is heterodyning by the
way! You do say you use a local oscillator which is centered at the
frequency spectrum center frequency of you spread spectrum signal, a la
homodyning).

I venture your spread spectrum signal at 900 mHz exceeds the bandwidth
of any of the nine amateur HF bands.

Now, how does your information bandwidth at baseband compare with
the required info bandwidth that is useful at amateur HF band frequencies?
Amateurs bandwidths are VERY narrow: RTTY 250 Hz for example,
PACTOR, etc somewhat wider. I have used 50 Hz bandwidth on CW
using the Comsoft Softwave DSPreceiver (not mentioned above, but built
into my Gateway Pentioum PC90, using an external RF box.) No
crystal filters involved, by the way.

Well, this gets the discussion started.

73, Jim, AH6NB for a few more weeks, probably.

The purpose of a layer 2 protocol is to *manage* layer 1, IE the
physical layer. That's what AX25 does here.

>>2) It provides the leading flags needed to synchronize the HDLC clocks.

Yep, just what a layer 2 protocol is supposed to do.

>>5) It provides the hardware addresses in its header to which logical

>around IP packets does.

Nope, but the PID is a useful thing for a mixed usage channel, and
the physical hardware addresses are essential.

>Well, that, and in the United States, keeping millions of hams out of jail. :-)

US amateurs are not required to use AX25 unless they are participating
in an unattended automatic message forwarding network.

>>[VC mode] [...] I'd suggest its use be avoided today.
>

>This because the UI frames are not acknowledged or re-transmitted, etc, one
>is implicitly depending on the higher level protocols (eg, TCP) to perform
>these functions.

Not implicitly, *explicitly*. That's the *job* of the transport layer.
It is why there is a layer 4. That job should not be pushed down to
layer 2 where it doesn't belong. Unfortunately, connected mode AX25
does kludge it down there, which is why I suggest mode VC not be used.

>This is a mistake, as anyone who has tried to run TCP over a non-outstanding
>AX.25 radio link knows all too well -- TCP stands a good chance of backing
>off to infinity or two minutes (whichever is shorter), and throughput drops
>to almost zero. This is not a bug in TCP, but rather a TCP design feature
>(good behaviour on congested networks) that conflicts badly with typical
>amateur radio reality.

Indeed, the transport layer is the proper place to deal with packets
dropped due to collisions. It is redundant to do so elsewhere. Using
retries at two different layers requires a layer violation to prevent
packet storms, and neither layer violations nor packet storms are good
things. The exponential backoff in TCP may seem too altruistic to amateurs
who prefer to bull into pileups rather than to take their turn in an
orderly fashion, but the latter course offers more aggregate throughput
for the network.

Now packet loss due to physical layer problems, IE weak fading channels,
excessive multipath, etc, should be addressed at the physical layer
by better RF path engineering and/or by better signal design. Depending
on ARQ for all of the packet reliable delivery issues isn't a good
division of resources. It is supposed to be a backup mechanism to
deal with issues the physical layer can't handle. As with any backup
mechanism, it is nice to have, but it isn't something you want to
have to *use* frequently.

>IMHO what is needed is a new link-layer that provides:
>
> a) items (5) and (6), given above.
>
> b) non-connectionless, low-overhead, frame retransmission

A connectionless link layer has the potentially very large benefit
of allowing dynamic routing on a packet by packet basis at layer
3. Amateurs haven't yet exploited this very much or very well, but
it is a powerful way for the network to self-heal or manage congestion,
and shouldn't be discarded lightly. I think self-healing in amateur
networks is so important that I very strongly discourage link layer
connection oriented protocols. And I much prefer to have my packets
routed around congested nodes rather than be choked there after
connection setup as they can be with connection oriented link
protocols.

> c) some measure of FEC to keep (b) from being invoked often.

FEC is really a layer 1 issue, like RF path engineering and signal
design. The link layer may need to manage it, but it doesn't need
to implement it. This is a grey area, though, and I'd accept FEC
as belonging in either layer depending on implementation factors.

> d) anti-HTS -- how many more years must the chaos continue??
>
> e) slim-and-trim headers -- bit-hack to the extreme (though within
> reason), so the protocol can be used relatively painlessly on
> on both slow-speed and very high-speed channels.

The bulk of the header overhead is in the 12 octets of physical address
information for origninator and receipient. I don't see a realistic way
of assigning unique physical addresses in less than 6 octets. Indeed, the
IP logical address space has recently been expanded to accomodate the
demand for unique addresses, making the IP header longer. As activity
increases, we have to recognize this need for address space and accomodate
it in header design. Vancouver protocol tried to use only one octet for the
physical address, and it rapidly became obsolete when more than 255
amateurs in an area decided to get on packet (and with HF and interconnected
packet networks, the relevant area is the world). The 6 octets representing
a call sign may be sufficient to amateur needs, though some amateurs have
run out of SSIDs, and the uniqueness is guaranteed by the governments
worldwide.

>and maybe,
>
> f) zlib data compression (dictionary generation/selection would
> be an interesting problem).

I think data compression is better left to the application or presentation layer, but I'm willing to consider placing it lower in the hierarchy. I see problems if layer 2 header information is compressed, and packet by packet compression is inefficient at best. It is better to do compression on reliable data streams, and those are found only above layer 4.

3499. Help! Recv Mod for IC-T21A

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-21 00:00:00 UTC
From: spike@castles.com
Message-ID: <3243d32c.2271490@snews.zippo.com>
Source record: 216451

I just recently purchased an Icom IC-T21A from an auction
and was able to receive out of band (ie 150Mhz), and I decided
to reset the MPU and start from the top. Now I can't get the thing
to receive out of band. Furthermore, I'm used to punching in all
the digits in the freq I'm using.

Can ANYONE please email me the buttons I need to hold
in at powerup to regain the expanded receive? Thanks
in advance es 73!

Well said, Carl. I agree 100%. The trouble is though, things will
never change as long as the CW loving ARRL is running the show.BTW, I
resigned from that lofty organization last year just because of their
assinine stand on code requirements. And for the "Try CW, You'll
learn to love it!" group, I say "Nuts to you." I worked on that damn

Morse Code until it made me sick. It's still just noise to me. Now I'm forever locked out of the HF spectrum because of this discriminatory rule.

>something better ... and maybe get some ideas going ...

Well, Carl, there are certainly other ways to implement the
link layer. Token ring is one, round robin another, and a
DAMA method is still another. If the network depends on
CSMA, however, AX25 datagram mode serves well enough.

You really have to look at the topology and nature of the
physical layer network to determine what makes a good link
layer protocol for it. I addressed some of these issues in
another reply.

And there's what I call a "social" aspect as well. Amateur networks
are typically ad hoc, often forming and dissolving relatively quickly.
That's one of our strengths (as well as one of our headaches). Token
ring networks are hard to enter and leave gracefully, and round robin
or other imposed scheduling systems require a central scheduling authority
which is vulnerable to single point failure. So most amateur networks have
retained simple CSMA architectures, and for that AX25 datagrams are good
enough at the link layer.

We could stand improvements at layer 1, IE better RF engineering, better
signal design, etc, and we could add some self-healing properties to layer
3 via a workable dynamic routing mechanism, but layer 2 is adequate as it
stands for the types of networks amateurs typically form at VHF+. (HF is
a different matter. Because of the topology, and the nature of the medium,
other strategies are required.)

The big problem I see when people say "lets fix AX25" is that the
problems they are really complaining about require fixes at other
layers, not another kludge to layer 2. In fact many of the problems
are *caused* by the kludges already thrown into AX25 that they shouldn't
be using, such as VC mode. AX25 is like a Swiss Army knife. It can be

a pretty good knife if you'll leave the dang corkscrew and can opener
folded out of the way.

>
>Of course, today it is considered inefficient. But it certainly wasn't
>an amateur invention.

I don't mean to imply that it was. Amateurs did agree to include
it in AX25, however, and that was a bad decision (IMHO) forced by
amateur politics (there were two extreme camps, one vehemently VC
and the other vehemently datagram, they were locked in a room and
told to come to a compromise). There was a lack of true network and
transport layers in amateur systems at the time, but the correct
solution to that (IMHO) would have been to adopt network and
transport layers, and not try to kludge them onto the link layer
where they don't belong.

Of course hindsight is 20-20, but there is good reason to obey
layer separation of roles. That's because it lets you somewhat
painlessly replace your mistakes without tearing down the whole
structure. Kludges are ugly, and they always remain ugly, no
matter how much goop we layer onto them.

>are also bottom of the barrel. They *do* offer higher grade (and
>heavier) models, though, while Coleman does not.

Gary,

I have to disagree with you on the Dayton. A freind has a 2kw model.
We have used it for Field Day and local Free Fleas. We use it to power
a commercial coffee maker and some test equipment during the Free Fleas.

These last about 4 hours and we do them twice yearly - for about the last
10 years. The little Dayton has been at all of them. Yes, it is heavy and
somewhat noisy, but it handles everything we have thrown at it. It also
runs very cool, even near its load limit. The regulation is pretty good
considering it has to handle going suddenly from nearly no load to nearly
full load when the coffee maker cranks up.

I am a little skeptical about generators that may be too light. I have
to ask if perhaps the maker is skimping on the alternator by not
providing enough core to prevent saturation and perhaps using
a gauge of wire that is too thin for the power rating.

Gary, you made a comment about trailer mounted generators. You
would prefer deisel. Well, maybe if it weren't for really
bad emergencies, like the aftermath of a hurricane. Gasoline
is more readily available. BTW - I think for a club involved
in emergency communications a trailer mounter generator is the way to
go, they are heads and shoulders above any portable.

The same fellow who has the Dayton also has a trailer mounted 5kw Kohler.
It is big and heavy. The powerplant is a 4 cylinder water cooled 12 hp
Volvo(I think) engine. When we really need serious emergeny power, it is
the cats meow.

This is one of the things you must consider for you club, the type
of service the generator will see. Most portables will require an oil
change every 24-36 hours. They don't take kindly to trying to extend that
period as they don't hold enough oil to withstand the abuse it is put
through.

A water cooled, trailer mounter gererator will run for weeks without
that requirement. Something to think about if you end up in a situation
where resources become scarce.

Hi Clay,

Carl didn't write that, I did, and it is quite true. ADSL uses a
telephone line and a new modem technology to provide simultaneous voice,
video (cable TV) and high speed data services. The data is 50 times
faster than a 28.8 modem. Very exciting for

Regards,

Jim - AD4VL

Bingo! We do *not* need an IBM ramming a crippled architecture
down our throats, and we do *not* need a Microsloth foisting
bloated and inefficient software down our throats, GUI GUI GAH!
The consequence of setting standards too early is that we're left
dealing with legacy systems and hardware and software that has to
be backward compatible for decades. That kind of thing we do not
need. Digital radio is still rapidly evolving. We do not want to
shackle it to legacy standards too early.

People are the critical resource. That's dead on the money.
Networking is 90% a people organizational effort and 10% a
technical development effort. Both are necessary, of course,
but without a critical mass of users, hardware development

alone is of little use.

I think the really exotic stuff will come on HF. That's the most
challenging radio environment. In terms of raw speed, the microwave
bands are where it is at, but speed is easy in a strong signal
gaussian noise environment like point to point microwave. There
is very little which is challenging there. It is point and shoot.

I think that the RF front end and the digital back end have to
be quite tightly coupled for best performance. Thus I think that
RF modems rather than "digital ready" radios are the direction
we need to take. Certainly we can do generic I/Q transmitters,
but generic I/Q *receivers* for high rate data are quite a different
thing. We still need analog filters at an IF tailored for the
particular signal design to get the performance we need for high
rate signals.

For the lower rates possible at HF, DSP already allows us to
directly process the I/Q signals, but not yet for high rate
modulations. Economical DSP is sneaking up on 56 kb, and I
would expect that to be practical shortly, but T1 and above,
that's going to be a while. So we'll have to brute force that
the old fashioned way for quite a while longer. Fortunately,
that's pretty easy, and we have bandwidth to burn at the
microwaves. We can even use plain old wide shift FSK.

Gary

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 21/2330Z SEPTEMBER 1996 BY IPS RADIO AND SPACE SERVICES
FROM THE AUSTRALIAN SPACE FORECAST CENTRE
SUMMARY FOR 21 SEPTEMBER AND FORECAST FOR 22 SEPTEMBER - 24 SEPTEMBER

1A. SOLAR SUMMARY
Activity: Very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 70/5

GOES satellite data for 20 Sep
Daily Proton Fluence >1 MeV: 4.7E+06
Daily Proton Fluence >10 MeV: 1.8E+04
Daily Electron Fluence >2 MeV: 1.3E+08 (moderate)
X-ray background: A1.5
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
22 Sep 23 Sep 24 Sep
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 22 Sep: 70/5

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: Active

Estimated Indices : A K Observed A Index 20 Sep
Learmonth 18 4243 4333
Fredericksburg 24 37
Planetary 25 31

Observed Kp for 20 Sep: 4455 4324

2B. MAGNETIC FORECAST
Date Ap Conditions
22 Sep 25 Unsettled to active
23 Sep 20 Unsettled to active
24 Sep 20 Unsettled to active
COMMENT: IPS Geomagnetic Warning 10 was issued on 19 September
and is current for interval 23-26 September. A geomagnetic disturbance
alert was issued at 2358 UT on 20 September for K = 5 during
the period 12 - 15 UT, 20 September.

3A. GLOBAL HF PROPAGATION SUMMARY
Latitude Band
Date Low Middle High
21 Sep Fair-poor Normal Fair
PCA Event : None

3B. GLOBAL HF PROPAGATION FORECAST
Latitude Band
Date Low Middle High
22 Sep Fair-poor Normal Fair
23 Sep Fair-poor Normal Fair
24 Sep Fair-poor Normal Fair

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Date T index
21 Sep -11

Observed Australian Regional MUFs:
Darwin: 10-30% depressed for the period 0000-1700UT,
otherwise near predicted monthly values.
Townsville: Depressed up to 20% for the period 0000-1700UT,
otherwise near predicted monthly values.
Sydney: Near predicted monthly values.
Hobart: 15-30% depressed for the period 0000-1200UT,
otherwise near predicted monthly values.

Predicted Monthly T index for September: 9

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
Date T index MUFs
22 Sep -10 Depressed 10-30% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.
23 Sep -10 Depressed 10-30% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.
24 Sep -10 Depressed 10-30% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.

Steve

The RS radios are way over priced. Saw the exact same radios advertised in some of the sportsmans' equipment catalogs advertised for $99.95. Another radio had an improved more featured version for $129.95. All manufactured by Motorola. RS is really screqwing the public with this pricing!

Message-ID: <8C8C4F8.00900049AC.uuout@spacecoast-bbs.com>
Source record: 216471

PS> Also I think the pro-Honda poster will find that a 5kw Honda costs a
PS> lot more than $800. Someone told me that Honda 4kw unit is over $2k.
PS> I'm shopping for the Coleman (and a muffler. They are very, very
PS> loud)
Pete-
I priced a Honda 3500 Watt unit at around $1300, two years ago.
My experience with a Coleman 2250 Watt unit a couple of years ago,
was that it was so loud that the neighbors got mad at me when I ran it. I
tried a larger Briggs & Stratton muffler, but it made little difference.
It also reduced the engine's power. Fortunately, K-Mart has a good return
policy!
How big a unit does the average home need? I suppose you could run
almost everything with 5 or 6 KW. I decided that it would be better for
me to go with a smaller one that would fit in the car trunk. The Coleman
2250 Watt unit was just right, in that respect. However, I subsequently
bought a Honda EX-1000. It is small and fairly quiet, but it won't run
much more than a Ham Station.
Does anyone work in a muffler shop? I have heard of people adapting
a small automotive muffler for use with a generator. I think this would
be a good project, worthy of being published in one of the magazines. If
someone would come up with a design for an inexpensive, readily available
generator fitted with an effective, readily available muffler, it would be
a valuable service to Hamradio.

Hmm. I lent out my copy of Starship Troopers about 25 years ago and it never came back, but I doubt this one. I suspect ol' RAH knew that the bit about "pursuit of happiness" is in the Declaration of Independence, not the Constitution.

Believing everything you read in RAH's novels is dangerous anyway -- one of the good-guy characters in "Beyond This Horizon" explains, unchallenged, that it's important for the government to print extra money and distribute it as a dole, in order to "soak up" excess productivity.

That's a hoot. Norman Abramson at the University of Hawaii (ever
heard of that place?) developed something called ALOHA in the 1970s,
which really was the original packet radio network.

If you're interested in making informed comments on the topic,
I suspect your library at the school there has plenty of info,
probably even all of the papers that were published.

Actually... Quebec is pronounced KAY-bec in phonetic English as well as
French. In some areas of western Canada, and the Maritimes
(Newfoundland espec.) local dialect of course alters the pronunciation,
ranging from QWE-bec, to KEY-bec. However Quebec is CORRECTLY
pronounced KAY-bec in English.

Jim,

You're apparently laboring under the missconception that digital
modulation techniques and DSP are expensive compared to the analog
techniques that you mention.

That's a mistake ... DSP is costing about a dime a MIPs nowadays ...
depending on volume ... my frame of reference is VERY high volume.

OK, so we're talking $5-6 for a 50 MIPS DSP ... $12-15 or so for 100
MIPS processor ... that puts it in the price range where DSPs are being
put in mass-market retail consumer goods ...

The technology certainly is NOT out of reach for amateur equipment
applications.

>VFO. I've homebrewed VFOs before from scratch and this project won't
>begin to come close to the detailed work that those necessitated. And
>it won't be as rewarding, either.
>

So you're stating that the use of *modern* parts like ICs means that
it's not "homebrew"???

What if I design the IC? (Something I do regularly at work ...) Does
that count?

What if I program the IC (as in a uController)? Does that count?

Or does it have to be solely discrete parts (tubes?) hand-wired between
nails pounded into a hunk of wood? (which is what you seem to view as
"homebrew")

We've already established that many, if not most, hams are not building
anything ... wouldn't getting lots of them building
(and debugging) ever-more-complex kits be a step in the right direction?

As usual, Jeff, your arguments are an outlandish mix of troll and
"traditional-eleteist" ...

Gary writes:
> That's a shocking statement, but it may be true. $10-$15 extra

Jim"

Of course I meant to type $10,000 to $15,000 for these prices!
And, yes, they are shocking.

But Mahalo to you Gary for your excellent explanation of the coming
digital techniques; I truly hope they are not to far out into the
future. Any chance before the next propogation peaks just
past the century turn? Only 5 or 6 more years. Clearly I do
not have the background to participate any further in this level
of technical discussion; my degrees, were in, of all things,
vacuum tube technology learned at Stanford in the mid 1950's!
You know, TWT's, Beam Parametric Amplifiers (the Adler tube from
Zenith Radio) etc. Stanford the home of the Varian' s Klystron and
the many technologies later commercialized at Eimac and so forth.
My particular assistanship project was a contra-wound helix
X-band TWT; contra wound in hopes of greater gain:
a hoped for 40 dB gain over the band; realized about half that, 37.

Anyway, too many decades have passed for me to get atop the
math, tecnhology, and integrated experiences leading to that of
which you have written to even hope to participate. Do keep on
top of your ideas, Gary, and try to urge someone here, such as
maybe the great guys at Ten Tec to begin marching in the direction
you propose and map out. They have already broken with the
Japanese in their approach to eliminating some inherent noise in
the phase lock loop approach in the LO synthesizer design. So
they do apply different ideas, at least.

The Contesting part of the amateur community has already gotten
together on the internet and presented several improvment ideas
to Ten Tec; upgrade ideas to the Omni VI they now have, but
certainly nothing as exciting as that which you propose.

Turn your piece into a proposal to them Gary, who knows, they
might be willing to grant you some support, if you should wish it
that is.

Anyway, thanks again, Gary. I am very grateful for the time you took
to respond so completely and deeply to my post. This is what the
amatuer radio community really is all about.

Perhaps I should, but I don't use a spelling checker on USENET posts. I
prefer to write my ideas while I'm "on a roll" and the spelling checker
slows down the progress through the threads more than I prefer.

I applogize for my fumbles and foibles ... I often try to type faster
than my mind-hand coordination will permit ... I have only partial
sensation and coordination in my hands due to a spinal chord injury.

And I do have a very complete dictionary ... I looked up "KF2TI" and the
definition it gave me was "jerk; idiot; nincompoop; insensitive boor;
often known to frequent USENET groups where he trolls for flames and
shows general lack of knowledge and respect for others"

Agreed ... for many reasons, not the least of which is that type
acceptance of ham gear would add *significantly* to its cost.

>That's because it is counter to the primary purpose of
>the amateur service, that of technical investigation.
>

Watch out there Gary ... you'll offend the masses who think that "it's
just a hobby" ...
This attitude is THE BIGGEST problem facing ham radio today and in the
future. It is the root of all of the problems that will threaten our
very existence in the future.

>
>The problems of concern in amateur radio don't appear to be
>related to Morse speed at all. In fact, enforcement records
>would seem to indicate that enforcement actions against
>amateurs fall disproportionately against those who have
>passed the highest speed Morse exam, IE Extras, who comprise
>the smallest amateur class, have the largest percentage by
>class of NALs filed against them.
>

I think that it's the "I'm an Extra, with a capital 'E' and I'm BETTER
than the average ham" mentality that leads the skofflaws to believe that
they can do whatever they damned well feel like.

I've often heard various jammers, jerks, and lids (complete with 1X2 or
2X1 calls) "doing their thing" and at the same time telling the
inevitable "channel police" who show up to tell them to shut up and go
away "I've been a ham for xx years, and I'm an Extra, so why don't you
damned well go back to CB where you belong?"

I think it's one of the clear proofs that the current class system
is ill-conceived and does far more harm than good.

>
>This may be indicative of persons lacking a strong internal

APRS can do this with maps and it works well for plotting locations
of repeaters.

The MAC version can be used with a QRZ/Buckmaster CD-ROM or a disk data base
to show any HAM in a user defined radius. You could just keep repeaters
in that data base. You can also plot by Lon/LAtT,gridsq or zip code.

goto www.tapr.com for programs (PC/win/MAC versions)

>can be accomdated.
>

If we don't use what we have more effectively, we'll ultimately lose it.
The current number of hams supported by our HF bands is a drop in the
bucket ... and our modulation techniques cannot even meet those that are
required under the FCCs new rules for the land mobile services (spec'd
in bits/sec/Hz)

>You'll argue that if everyone used the latest fad mode we would have room
>for an unlimited number of folks; but you refuse to face the reality that
>we're not all going to shift to your mode of choice. You're guilty
>of espousing that ("you *must* use my mode") which you've condemed ("why
>*must* I learn the code?")
>

We'll HAVE to adopt more efficient modes in order to accomodate the
numbers we must have and to meet the spectral efficiency criteria that
we'll be measured by, in order to survive the "value of
service/technology vs allocated spectrum" measurements we'll be
subjected to in the future.

With the FCC mandating the adoption of more spectrally efficient
modulation techniques in the land mobile (Part 90) bands and teh
cellular phone folks adopting them for financial reasons (more
capacity=more subscribers=more $$$), how can you assert that we can sit
on our asses and continue to use outdated technology that's far less
efficient??? And don't give me the standard "its' ONLY a hobby" crap
.. that's false and doesn't address the threats.

>One wonders why you're not chastising the SSB crowd for their wide-
>bandwidth mode - uses more than CW.
>

SSB is actually *more efficient* than CW ... in terms of information
conveyed per Hz consumed. The fact that its bandwidth is wider than
even fast CW is irrelevant to the issue of efficiency. To argue to the

contrary only shows a lack of understanding of the issues involved.

>>We need more people, not less ... but yes, they should be qualified to
>>safely operate radios without hurting themselves or others, and without
>>causing harmful interference to other services ... that's all.
>
>You say we need more people on HF but you don't even have HF privileges (do
>you even own an HF rcvr?). And RF safety is *not* enough. We're the only
>radio service privileged to build and modify radio equipment; much more
>knowledge of electronics is needed than you are proposing.
>

Don't try to twist what I said into implying that I advocate a
reduction in theory testing ... I've openly said that the present
written exams are a joke and should be mmuch tougher ...

>then you deserve everything you get. Don't vote!! don't bitch
>when you don't get your way
>
>

Oh, I NEVER SAID I didn't return MY survey ... I did ... the very next day, and it firmly indicated MY views ... eliminate the code test, it's an anacronism that's hurting ham radio, not helping it ...

My point was that many (no-code advocates) who receive the survey probably won't send it in becasue they figure the ARRL is not sincere (having faught no-code for so many years).

And even if EVERY ARRL "member" sent in the survey, so what? Less than a third of US hams are "members" and huge numbers of the "members" are really just "QST subscribers", so who really cares what the ARRL survey says?

Government regulation of spectrum is NOT a "popularity contest" ... it's *supposed* to be a "public interest contest" where the regulators decide who gets spectrum on the basis of what uses do the most good for "the public" in general ... ham radio is on the downslide in this measure .. we must increase our numbers, overcome the "it's ONLY a hobby" mentality, and adopt (and INVENT) new technologies that allow more efficient use of the spectrum we have ... we can do all of these things, but THE major hindrance is the code test, followed by some backward rules regarding bandwidth, use of different alphabets/coding schemes, etc. and CW identification (DUH!) of new waveforms like spread spectrum.

3537. DX and Satellite Cyberscheds available at http://www.sarrio

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-22 00:00:00 UTC
From: wb6siv@cyberg8t.com
Message-ID: <wb6siv-2209961118120001@host44.cyberg8t.com>
Source record: 216318

This is a new use of the WWW that can benefit ham radio operators throughout the world.

You can now schedule contacts with hams all over the world simply and easily by using the WWW and e-mail.I have set aside a section of my web site for hams to post their request for over-the-air schedules. Included in the posting is a place to list the posters specific ham radio contact needs (countries, zones,IOTA, grid squares ect...). The postings will also include an e-mail link that will allow hams that read the posts, to easily request an over-the-air schedule.

How Can Cyberscheds work for me?

Do you need a certain state to complete a WAS award? Are you just a few countries away from a DXCC? Are you a QRP operator looking to make contacts with hams all over the world? Are you a DX station that has grown tired of the stateside pile-ups on 20 meters? Or are you going mobile into a hard to work county?

In all the above examples you could have prearranged cyberscheds with those hams that you want to work. If band conditions are poor just e-mail the hams you could not work and set up a new schedule.

Cyberscheds are a simple way to have the internet work to the benefit of hams all over the world.

All posting will stay on-line for 6 months, or until the posting is asked to be deleted. Below is an example of one cyberpost visit the cyberpost page and view them all. Below is an example of one of the postings:

Station: BV/N0IAT

Name: Joe Fitter
QTH: Taipei, TAIWAN Republic of China
Bands: 40/20/17/15/10
Mode: CW (occasional SSB, but not much)
Comments: Looking for South America, Central America, and Carribean QSO's. I QRV from a
neighbors shack (local law), so operating times are limited to station availability. QSL via my CBA --
I DO NOT accept IRC's or Greenbacks, just please send me your QSL card and a route for returning
the favor.

Jim,

The GOOD part is that he became a ham BEFORE the "pro-code cretins" got
to him ... with results exactly opposite to those they intended, by the
way.

The BAD thing is that lots of "pro-code cretins" get to LOTS of
prospective hams BEFORE they actually become hams ... with the result
that they're turned off, turn away, and NEVER become hams ...

You guys just aren't the "good PR" for ham radio that you think you are
..

>pouch.

I've been through security in Chicago and Minneapolis many times and not once did I have a problem with my toys. Once I had an alarm clock in my carry-on and they wanted to look at it, but no big deal. However, at airports here in Canada, I've almost had to be strip-searched
each time I bring a toy through security. Had to show the shortwave radio worked, had to dial up ATIS on the scanner, had to make a cellular phone call, play a tape, all to the amusement
of passing passengers! And this is at a very small airport. Grrrr. But not as serious as your encounter in Germany.

No, not true ... what I've been saying is that there's a lot MORE to our
RESPONSIBILITIES and too many people take the "it's JUST a hobby" view.

Yes, I've made some comments that a lot of what you hear on the bands is
mindless drivel, of questionable value ... and I truely feel that way
.. but it doesn't mean that I think it should be censored ... I just
find a more interesting conversation to participate in ... the jammers,
cursers, and other sub-humanoid types should be caught, fined, and
barred for life from owning ANY transmitting apparatus ...

>

My father had a huge old console radio, bought before WWII.
It had 40 tubes and weighed a ton (figuratively). But today
I have a Walkman style radio using 2 ICs that receives just as
well (better when you realize it does stereo too). The old radio
piled elaboration on top of elaboration trying to get the last
ounce of performance out of an old design technique. It had
knobs on it for which neither my father nor I ever figured out
the purpose. The new radio is very simple because it uses different
design techniques, but it works better.

The old receiver didn't have dual loop synthesis or a stereo
decoder. These things weren't even considered by its designers
to be practical circuits to use. But they are relatively routine
and trivial features of the newer design.

My point is, that the last gasp of an old design paradigm is
often large, elaborately complex, and expensive while the follow
on technology is smaller, simpler, and less expensive, but
offers better performance. In this regard, I'd consider the
latest multiple IF rigs from the Japanese amateur manufacturers
as a last gasp elaboration of an old design paradigm.

The new paradigm, just coming into view, is the homodyne quadrature
receiver with direct DSP processing of the I and Q channels. That's
become possible with the advent of 32 and 64 bit DSP processors,
yielding a dynamic range unthinkable to digital processing only a
short while ago. (96 db for 32 bits and 192.7 db for 64 bits)

The main reason to use multiple IFs is to distribute gain so
that stability isn't compromised, to allow sliding rectangular
response filters against one another to generate variable
bandwidth responses, and to allow practical AGC systems to
handle the required dynamic range. Since the gain of the DSP
processed I/Q receiver is supplied by multiplication in the
digital domain, and since the required dynamic range can
be directly accomodated in 64 bits, and since any arbitrary
filter can be synthesized in DSP, the need for the elaboration
of multiple IFs is eliminated.

This is a whole new way of thinking about receiver design,
a paradigm shift, made possible by the advance of digital
signal processing components. This is as much a revolution
in this area as the IC replacing the tube was to the analog
era. The price of a 32 bit DSP chip is now in the $15 range,
and the price of a 64 bit DSP, while still much higher, is
falling rapidly. In the next generation of receivers, the
DSP won't be an afterthought, a fillip tacked onto the end
of a conventional receiver design, it will be the integral
heart of the receiver, because it will allow the receiver
to be simpler, cheaper, and better.

Now lots of folks might be saying "Ho hum, what's this
do for me?" And they're right to ask that question. The
direction of the cost curve is one answer, the digital
processed receiver will be cheaper. Another more significant
factor, however, is performance. The current generation
receivers perform very well within the limits of their
paradigm. But that paradigm is based on rectangular response
filtering. DSP allows us to generate matched filters for
any arbitrary signal design.

This isn't just a rectangular response, because few signals
generate a rectangular spectrum. This is a complex response
accounting for signal phase and amplitude momemt by moment.
With proper signal design, this allows us to directly
extract Eb/No, which is typically very different from the
naive SNR in a rectangular bandwidth. In other words, it
allows us to detect properly designed signals well below

the naive SNR noise floor of the system.

To achieve maximum benefit from this, of course, properly designed signals have to be used. While there is some benefit for haphazardly designed signals, maximum benefit comes from signals designed to take best advantage of this matched filter response. The class of coherent digital signals fit this criteria perfectly. So maximum benefit of this new paradigm will only be obtained by using properly designed digital signaling techniques.

This latter factor may partially explain why the Japanese manufacturers of amateur equipment haven't rushed into this newer design paradigm. Amateurs cling to traditional signaling techniques and haven't yet widely adopted the superior digital signaling techniques now becoming available for which an I/Q receiver design would deliver maximum benefit.

Ironically, the use of I/Q technique coupled with matched filtering gives old fashioned AM an advantage over SSB for reception in noise. It's only 6 db, but HF amateurs often go to great lengths to achieve 6 db of gain (directive antenna arrays for example). But with properly designed signals, the advantage can be much larger. For example, PACTOR II in its most robust guise has an approximate 28 db difference between Eb/No from a matched filter and the naive SNR in a rectangular bandwidth, IE at -18 db SNR, Eb/No is +10 db. That's much more than can be gotten from a linear amp and a directional array.

I've been experimenting for the past few months with these techniques on the bench, using a front end design borrowed from the R2 with the I and Q feeding directly to the stereo codec on the Analog Devices DSP EZ-Kit Lite. Now that unit only has 16 bit sampling, so dynamic range is compromised, but with properly constrained input signals, performance has been spectacular. I have been able to perfectly extract 400 baud QPSK signals buried in noise using matched filtering. The signals are inaudible to the ear when I and Q are combined through just a 90 degree shift and low pass filtered, IE conventional rectangular filter recovery.

These experiments give a strong indication of what is possible for this technique when used with more powerful chips which can handle real world dynamic range.

Notes:

Actually, I'm using a correlation algorithm, but signal theory says that's equivalent to a matched filter.

The noise sources I've used are 29 MHz and 27 MHz band noise sources, yielding near gaussian and non-gaussian noise

distributions respectively, IE it still works when mixed with
CB Ch 19. These are obtained via a TRF stage feeding an adjustable
passive combiner so that I can vary the ratio of band noise to
my test signals. This combination is then fed into the receiver.

The test signals are generated by a ripoff of the T2 circuit,
being fed I and Q from my PC's sound card playing stored WAV
files generated from MathCad data files.

Note that these techniques work best with the LO locked to
the desired signal, IE synchrodyne reception. I've simulated
that by using a common LO for both the test transmitter and
the receiver. I also have tried driving my receiver LO (an
IFR500) through its FM input with a correction voltage,
generated by the DSP program in bang-bang fashion out its
RS232 status port to a hold capacitor. This forms a crude
phase lock system which can lock it to the signal generated
by the T2 when driven by a separate LO. (This is very crude,
of course, I wouldn't recomend this as a way to build a practical
phase locked receiver, but it works well enough for benchtop
tests to demonstrate the concept that the DSP can generate the
information needed to lock the LO to the signal.)

Not counting the IFR, which I already had handy, this lashup
cost less than $100, most of that the DSP evaluation board.
But it offers performance beyond either my IC735 or my IC706
under the test conditions given. I'm confident that it
outperforms the latest and most expensive Japanese radios
as well (under the test conditions used, it doesn't have the
dynamic range needed for the real world due to the 16 bit
limitation of the DSP I have).

Gary

>use a narrower filter, than any modulated carrier, including OOK
>modulation.

I've been talking strictly about systems capable of conveying useful
information ... if you want to pick nits, fine ...

There is no such thing as an "infinitly narrow unmodulated carrier" ...
every oscillator has phase noise ... some are quiter than others ...

Besides, we agreed that throughput goes to zero as the signal is made
arbitrarily narrow in order to reduce the noise floor in the
arbiratrily narrow receiver filter, etc.

>>>
>>>Coding gain doesn't help you if you can't detect the signal.
>>
>>Yes, Gary ... I didn't say anything about repealing the laws of nature
>
>Apparently you did.

No I didn't ... I'm not claiming to lower the detection threshold ...
just that properly coded digital signals can be received at levels where
a CW operator couldn't even detect the presence of a CW signal.

EMERGENCY FUNDING

The following is an important closed circuit advisory. Attention all bulletin stations. Newsline is once again on the verge of bankruptcy and existing hand to mouth. We urgently need your support to survive.
As we have said many times, the decision whether Newsline stays or goes is yours. If you want this service to continue, we will need your ongoing financial support, and it is needed right now.
The address for the Newsline Support Fund is:

NEWSLINE
P.O.Box 660937
Arcadia, California
91066

This ends the closed circuit with Newsline report number 997 for release on Friday, September 20th, 1996 to follow.

(*****

The following is a QST

The ARRL questions the need for Supernet, Vanity Gate 2 opens soon and ham radio triumphs over the cellular telephone. Find out where on Newsline report number 997 coming your way right now:

(*****
ARRL QUESTIONS SUPERNET PROPOSAL AT 5 GHZ

The ARRL is questioning the need for the N Two service at 5 GHz. In comments filed with the FCC on a proposal to make available 350 MHZ of spectrum at 5.15-5.35 GHz and 5.725-5.875 GHz for use by SUPERNet devices

the ARRL suggested that allocating 350 MHZ for the devices is excessive and premature. This, in view of other opportunities for high speed data communication.
The Supernet proposal came in response to Petitions for Rule Making from Wireless Information Networks Forum and Apple Computer Inc. The spectrum requested includes part of the shared Amateur Radio allocation at 5.65-5.925 GHz. The proposal calls for use of unlicenced Part 15 devices would provide short-range, high-speed wireless digital information transfer. These same devices could also support new wireless local area networks and facilitate access to the Internet or other facets of the National Information Infrastructure.
But the ARRL says that the Commission's proposal for short-range Part 15 facilities is as far as the Commission can or should go with unlicenced devices. That anything designed for a longer range should be licensed.
The ARRL also cited comments by Pacific Telesis Group. Pacific Telesis says that the 350 MHZ of spectrum not be committed to a service with unproven technology and untested market acceptance.

(*****
NEW OKLAHOMA SECTION MANAGER

Coy C. Day, N5OK, has been elected Oklahoma ARRL Section Manager. Day pulled 475 votes to 149 for Richard E. Russell, KJ5VV. Day takes office October 1st. He replaces CQ magazine writer Joe Lynch, N6CL, who is studying for the ministry and did not seek re-election.

(*****
GATE 2 REMINDER

A reminder that Gate 2 of the Vanity Call Sign Program opens on September the 23rd. The ARRL says that a number of hams have questioned the application requirements contained in the recent FCC announcement on the start of Gate 2. The League says that the confusion arose over the FCC's statement that each call sign must be one designated for the Region of your mailing address.
FCC Fact Sheet PR-5000, Amateur Station Sequential Call Sign System, defines the regions and the types of call signs you may properly select. Briefly, those living anywhere that the FCC issues ham licenses may apply for a call sign from any of the 10 call districts and in any other call district. This means a ham in Missouri could apply for a call sign with a K1 prefix. He or she would not be restricted to a call sign containing a numeral 0.
In addition to regions 1 to 10, applicants with mailing addresses in Alaska also may apply for call signs from region 11, while hams in Hawaii also may apply for call signs from region 13.

(*****
PHASE 3D LAUNCH UPDATE

Earlier this year the failure of the Ariane 5 launch vehicle put a big crimp in the launch schedule for AMSAT Phase 3D. Recently, the ESA completed their investigation of the mission and now Ariane 502, the second

launch of the vehicle series, is slated for sometime in the first six months of 1997. Possibly as early as mid February.
This will be the launch that puts the largest, most complex amateur radio satellite ever built into orbit. Now the pressure is on the satellites construction crew. To finish the final assembly and testing before the assembly is shipped to South America.
This is the most ambitions space communications project that the amateur community has undertaken. Even after a successful launch the spacecraft will take possibly up to a year to obtain its optimum orbit. The last step on a long journey are now being taken down in Florida. As the launch date approaches, amateurs the world around cross their fingers and look foward to the day when they fly in spirit once again.

(*****
EMWIN

If you're a ham involved in emergency communications, or if you're a weather buff, then the federal government is launching a new service you may not want to be without. It's called EMWIN. And it was one of the hottest new attractions at the Huntsville Hamfest August 17th. This new system brings a variety of weather information directly to your home computer, in real time.

Steven Terry, WB4IZC, isn't selling radio equipment, but his display booth is one of the busiest. Scores of hams are fascinated by what they see on a computer screen. Terry is busy answering questions about EMWIN, a new weather information network offering everything from satellite pictures of hurricanes and tornado warnings to forecasts and summaries.

"And you can manipulate them, anything you want. You can get aviation weather, river stages, national forecasts, zone forecasts. The new software is coming out in January. I believe you will get alerts down to the county level." WB4IZC

The National Weather Service wanted to make its weather products as widely available, as inexpensively as possible to anyone interested in receiving them. EMWIN is the result. EMWIN stands for Emergency Manager's Weather Information Network, the system is intended as a low cost way for emergency management agencies and other groups to receive weather information instantly and in real time.

"The weather service set of a tornado watch in Tulsa. Thirty seconds later it popped up on the screen coming of the satellite." WB4IZC

You capture the products you want in your PC. EMWIN's software even lets you create a loop of satellite pictures. You can set alarms to sound when certain information comes in. Steven Terry says EMWIN offers obvious benefits to radio amateurs:

"One of the main uses is for hams who are out spotting for the National Weather Service. You got the radar information, the warnings, the watches. You got it right there with you." WB4IZC

EMWIN'S signals are free. You pay only a one time charge for the equipment and software needed to receive and process the signal.
You can receive EMWIN's signals directly off the government's GOES weather satellites. That means you'll have to buy the needed satellite receiving equipment, which right now can cost more than a thousand dollars. But, EMWIN's creators hope the signals can be made available in local areas on VHF or UHF frequencies, that could make the cost of receiving EMWIN only a few hundred dollars.
Andy Farnsworth, KD4YJQ, of Nashville, has been looking over the colorful screens full of satellite pictures and warnings. He likes what he sees:

"I think it's very new and very good. Especially when you can receive it out on the road is a very nice feature." KD4YJQ

EMWIN's popularity is growing rapidly. Five VHF stations already transmit the signals in Oklahoma, efforts are underway to put EMWIN transmitters on the air in Tennessee. Steven Terry is helping make EMWIN available too, using the subcarrier of Memphis radio station WYPL, which he manages.

You can get more information on EMWIN on the World Wide Web, both from companies selling the equipment and from EMWIN's home page. And you'll find an article on EMWIN in the August issue of Monitoring Times magazine.

(*****
NEW ARRL AUDIO-VISUAL LIBRARY PLAN

The ARRL's Educational Activities Department is changing the way its audio-visual system works. Instead of borrowing tapes from league headquarters, affiliated clubs can now order videotapes to keep for just $12 each. Each of the eight available videos contains 2 to 4 programs, or about two hours of programming per tape. The League says that this will permit clubs to build a video library that can be used whenever a club wants, and doing so at very little cost. In fact, the League says that the $12 fee is its cost for duplicating, shipping, and handling.
For complete information about what is on the tapes and how to order them, send a self-addressed stamped envelope, with the notation "New A/V System," to the Educational Activities Department, the:

ARRL
225 Main Street
Newington, Connecticut
06111

(*****
TECHSAT ON THE WWW

The Techsat project - Israel's first Amateur satellite now has a site on the world wide web. Its Universal Resource Locator is:

www.technion.ac.il/~asronen/techsat

If you were not able to copy that all, there is an easier way to find the site. Simply go to one of the on-line search engines like Yahoo or Alta Vista. Type in the word Techsat and the search engine will bring it to you.

(*****
INDIANA BEACON

Brian Bell, N9XDW reports that a new six meter beacon is on the air from Mooresville, Indiana. Its call sign is KG9AE and it can be found on 50.065 MHZ transmitting in CW. Its purpose is to draw attention is to draw attention to the 53.450 MHz and 444.575 MHZ linked repeaters that serve central Indiana. QSN reports go to KB9DJA at his callbook address.

(*****
UK BEACON

Englands' Emley Moor 70 centimeter beacon, GB3MLY on 432.910 MHZ returned to service on July 27th. This after having been off the air for about three months. It is now using a new ruggedized 6 element Yagi antenna beaming at 170 degrees. Any reports should go to:

Peter Blakeborough, G3PYB at his callbook address.

(*****
CONTEST NEWS

From the contest log, word that the Chairman of the RSGB VHF Contests Committee, Steve Thompson, G8GSQ has recently changed his call sign, address and phone number. Steve, who was formerly GW8GSQ, can now be contacted at:

P.O.Box 2399
Reading, RG7 4FB

Steve can also be contacted by e-mail to:

g8gsq@blacksheep.org

(*****
DX

In DX, and still from across the Atlantic, word there is now a new RSGB QSL Bureau sub-manager for the United Kingdoms' G0I series of callsigns. He is Anthony Lord, G4KHT, whose address is correct in the latest callbook. Lord takes over the position from Mr. I Webb, G4JFF.

Also, David Faigue KE6JQP of Simi Valley, California writes to say that the claim by four DXers that they will be the first non-essential personnel to step foot on Midway Island in over 100 years is incorrect. Dave says that he personally visited Midway back in 1973 while in the Navy. He also notes that Pan American World Airways operated their Midway seaplane base from 1935 to 1946. Passengers would deplane at Midway and spend the night at a hotel before continuing on their journey on board the famed Pan Am Clippers.

(*****
SIX METER AM RADIOS WANTED

This note to hams with old six meter AM rigs sitting in their closets and out in garages. The Southern California Six Meter Club is seeking donations of any kind of older six meter AM equipment that can be restored to functional use. The club will fix the gear and then make it available on a free loan out basis to other hams who want to try out the six meter band. If you have an old rig like a Gonset Communicator, Clegg 99er, Solar System Six, Lafayette HE 45 or any late 50's through early 60's radio that you can donate, drop a line to the Southern California Six Meter Club. The address is

Post Office Box 10441
Fullerton, California
92838

(*****
DELTA INFLIGHT SATELLITE TV

Satellite television is coming to the airlines. This with an announcement by Delta Airlines that it has outfitted one of its Boeing 767 jumbo jets with equipment to receive ten channels from the Direct TV subscription service while in flight.
The aircraft is named the Spirit of Delta. It will be flying domestic routes and providing the new service in place of the usual movies and information videos. Programming will include Cable News Network, Headline News, CNBC and the Discovery Channel.
The experiment will last six months after which the airline will decide on whether this type of service could be installed in its fleet.

CELL FONE FAILURE

Ham radio was there to jump in and fill the breach when cellular telephones failed to provide the promised communications for a major public event. It happened over the July 4th weekend of the Twin Cities to Chicago Bike Ride to fight AIDS.
According to Dave Deiler, KB9JKV, the event was running well using cellular telephones for all communications until the entourage reached central Wisconsin. Suddenly the cell phones would no longer work cutting the group off from one another as well as the outside world. Enter ham radio.
Late in the evening on July the 1st, a plea was herd on Madison, Wisconsin 147.150 MHz repeater for hams to bring their gear and take over where the cellular telephones had left off. Even though it was a holiday weekend enough radio amateurs were found that normal communications for the ride could be resumed.
Dave says that when the riders reached the Janesville area of southern Wisconsin that they were back in cellular telephone coverage but that the communications loss was one that the group did not want to experience again. Rather than rely on the nations cellular system, ride organizers opted to recruit ham radio communicators along the route all the way into

Chicago.
Cause of the cell phone failure? Not enough cell sites covering the
central Wisconsin terrain.

One of the reasons I like diesels is that the fuel can be stored
for long periods. You can't do that with gasoline. So when that
really bad emergency hits you don't have to go looking for fresh
fuel right away.

You can get gas for a gasoline generator from a car, but the
anti-siphoning fillers on newer cars make that hard, and
filling stations have underground tanks which may have been
contaminated by water, and require the power be on to work
their pumps. Diesel can be gotten from any long haul truck,
and their tanks are easier to siphon, or from farm equipment,
or heavy equipment.

A diesel can also run on home heating oil, JP4, kerosene, or
even vegetable oils such as peanut oil, corn oil, or other
cooking oils. They stink a bit, but they work. The diesel also
is usually more fuel efficient, so you don't need so much fuel.
And the diesel is usually more rugged, and usually lasts longer,
than gasoline engines.

Before hooking into your house system, you might want to check with your local power company about rules/laws or whatever. I know in this area they are pretty strict about how the cutover is done. I guess they have lost a couple of linemen due to up-line feedback from home brew setups. Could be a serious liability exposure.

What might be true on the drawing board doesn't always occure in practice.
So far, CW still ranks highest when *all* possible variables such as
simplicity of equipment, inexpense, number of users worldwide, performance
versus power, real-time passage of data, bandwidth needed (~500Hz), are
considered. Also, being able to decode xmissions mentally rather than having
to rely on complex equipment is one of the greatest factors to consider.
It's true that CW doesn't lend itself well to passage of large files that
few will ever take the time to read, but that type of data can best be sent
in a much quicker fashion via internet.

> - Brian

I hear what you're saying, Brian. But ARQ is a *backup* procedure, and like any backup procedure, you hope you never need it, and do everything you can to avoid needing it. Those "aggressive" VC link retries just clog the channel. The better solution is to deal with the underlying physical layer problem.

That can take many forms. Better RF path engineering is one way. Revising the network topology so that the CS in CSMA can really work is another, IE get rid of the hidden terminals. Better signal design is another, as is use of FEC in the physical layer modem. Etc. Just hammering the channel with retries isn't a good solution. It just causes problems for everyone else.

And if you get retries on a hop, TCP will likely time out and retry too, and that'll wind up at the node doing the link level retries and be retried too, etc, until you have a packet storm on your hands. Ugly.

Now hop by hop acknowledgements have a value, if every hop is a contending one. But that's a bad network topology. A better topology has the network trunks above the LAN level be non-contending point to point links.

Hop by hop acknowledgements could have another value if they were communicated to the network as a measure of link quality, however. That way the network routers could divert packets around that faulty path and flag it for maintenence attention. (Netrom addresses this issue after a fashion.)

I realize that VC can make some systems "work", but it doesn't make them work *well*. It's like putting a bandaid over a skin cancer. It masks the problem, but it doesn't solve it. It's a kludge, and an ugly one. Mode VC retries remind me of the slogan over the workbench which reads, "Why is there never time to do the job right, but always time to do it over?"

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 22/2330Z SEPTEMBER 1996 BY IPS RADIO AND SPACE SERVICES
FROM THE AUSTRALIAN SPACE FORECAST CENTRE
SUMMARY FOR 22 SEPTEMBER AND FORECAST FOR 23 SEPTEMBER - 25 SEPTEMBER

1A. SOLAR SUMMARY
Activity: Very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 69/3

GOES satellite data for 21 Sep
Daily Proton Fluence >1 MeV: 3.8E+06
Daily Proton Fluence >10 MeV: 1.8E+04
Daily Electron Fluence >2 MeV: 6.6E+08 (high)
X-ray background: A1.7
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
23 Sep 24 Sep 25 Sep
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 23 Sep: 69/3

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: Active to minor storm

Estimated Indices : A K Observed A Index 21 Sep
Learmonth 21 3343 5423
Fredericksburg 21 24
Planetary 20 24

Observed Kp for 21 Sep: 5544 3433

2B. MAGNETIC FORECAST
Date Ap Conditions
23 Sep 25 Unsettled to active, with the chance of minor
storm periods.
24 Sep 20 Unsettled to active, with the chance of minor
storm periods.
25 Sep 20 Unsettled to active, with the chance of minor
storm periods.
COMMENT: IPS Geomagnetic Warning 10 was issued on 19 September

and is current for interval 23-26 September. A geomagnetic disturbance
alert was issued at 2204 UT on 22 September for K = 5 during
the period 12 - 15 UT, 22 September.

3A. GLOBAL HF PROPAGATION SUMMARY
Latitude Band
Date Low Middle High
22 Sep Fair Normal Normal
PCA Event : None

3B. GLOBAL HF PROPAGATION FORECAST
Latitude Band
Date Low Middle High
23 Sep Fair Normal Fair
24 Sep Fair Normal Fair
25 Sep Fair Normal Fair

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Date T index
22 Sep 1

Observed Australian Regional MUFs:
Darwin: Depressed up to 20% for the period 00-09UT,
otherwise near predicted monthly values.
Townsville, Sydney and Hobart: Near predicted monthly values,
with some spread F observed during local night at Hobart.

Predicted Monthly T index for September: 9

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
Date T index MUFs
23 Sep 0 Depressed 10-30% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.
24 Sep 0 Depressed 10-30% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.
25 Sep 9 near predicted monthly values

Jim,

Try my Shareware Morse Code program, International Morse Code Processor
(IMCPW311.ZIP), at

http://www.simtel.net/pub/simtelnet/win3/ham/imcpw311.zip

Below are its major features:

Morse code tutor for Windows 3.1 & Windows 95. Excellent for learning
and maintaining one's Morse code skills. Provides code speed of 3-50 wpm
and character speed of 10-50 wpm for Farnsworth code. Includes
comprehensive help facility, main menu and popup menu, and eleven code
practice lessons. Fully customizable from the Options menu. Sound card
not required. Requires 692K of free hard disk.

73,
Lindsay
WA4ISZ

A written test is only necessary for safety because you >think< it is.
It would be just as easy to put a guide on safety in with every radio
sold, and leave it at that. I seem to recall that all CB rigs had a
section on safety in their manuals.

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 271
BID: $OPDX.271
September 23, 1996
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, AD1C, K2YJL, KA2AEV, N3ADL, KJ4VH, W5IJU & Island News, KF7AY, W8KKF, W9JOO, CT1EEB, DL2GGA, DJ8WL, G4BUE & the DX News Sheet, IK1DPA, ON6TT and VE2ZP/VE9CB following DX information.

1S, SPRATLY ISLANDS. Jaan, 9M2JJ, has obtained permission to be active from Pulau Layang. The Spratly Islands have been claimed by several countries, but Jaan has receive permission from the Malaysian authorities who want to issue a 9M6 callsign instead of the traditional 9M0 callsign. Jaan has refiled another application, but with reference to the previous 9M0A and 9M0S operations and is awaiting a reply.

3V, TUNISIA. Be looking for Peter, OK1CZ, this week to be active as 3V8BB until October 1st. Operations will be on all bands, but mostly CW. He will try working on 160 meters (conditions permitting) on 1826 and 1828 kHz. Also check 6 meters on 50.120 MHz and 2 meters on 144.050 MHz. QSL to CBA.

5X, UGANDA (More News). Peter, ON6TT/5X1T, reports Gus, 5X1D, has been active on 160 meters on 1823 kHz between 0230z and 0330z (with 100w only). Peter mentions his famuous low band antenna is still blocked in Burundi due to the economical embargo. He will try to work stateside this week on 40 meter SSB, up to 0000z. Peter requests that North America stations listen from time to time in the Region 1 SSB-band (7040-7080 appr.). He also states that the 40 meters paths to the U.S. from 5X are terrific both ways.

CANADIAN SPECIAL PREFIXES. On 13 September 1996, Industry Canada authorised all Canadian Amateurs to use special prefixes to commemmorate the 60th anniversary of the Canadian Broadcasting Corporation (CBC). The CBC was founded by an act of the Federal Parliament on November 2, 1936. From 0000z October 26th until 2359z December 29, 1996, Canadian Amateurs may use the following special prefixes in place of their regular prefixes

(Regular Prefix/Special Prefix): VA2/XM2, VA3/CJ3, VA7/VX7, VE1/CG1, VE2/CI2, VE3/CI3, VE4/XL4, VE5/XM5, VE6/VA6, VE7/XK7, VE8/CH8, VE9/VB9, VO1/XO3, VO2/CZ6, VY1/CK5 and VY2/XN2

CHANGE OF ADDRESS. Terry Long, W9JOO, of "Island Hopper" reports his bulletin has a change of address: 420 W. Adams St., Roann, IN 46974 Phone Number/FAX: 317 833-6800 E-MAIL: qrziota@netusa1.net Also, free copies of "Island Hopper" are still available if you E-mail Terry a message with your callsign and mailing address.

C6, BAHAMAS. John, K3TEJ, and Ed, WA3WSJ, plan to operate in the CQWW CW contest (November 23-24th) from Abaco Island (IOTA NA-80). QSL via K3TEJ.

CN, MOROCCO. Andy, DL2GGA, will be here October 15-24th, and plans to be active from the club station CN8MC (but probably using his own CN callsign which has not been issued yet). He will try to be active on all HF bands, CW exclusively. Andy states he doesn't know about CN8MC's antennas for 80 and 160 meters, but he will announce any activities on these bands during daytime operations. Listen up and KYFC. QSL via DL2GGA bureau is preferred; urgent requests via CBA 95/96. Please allow some time for designing and printing the QSLs (at least 2 months).

KC6, BELAU. The "Island News" reports Paul, LX2AA, will be active in the CQWW SSB Contest as KC6GB (or T82AA), and possibly just as T88A from Helen Reef in Palau's southwest islands (possibly a new IOTA reference). QSL via CBA.

OOPS DEPARTMENT..... There is a correction to OPDX.270. Under the heading J3, GRENADA (Need another operator), the QSL information was incorrect. QSL J3A via WA8LOW (not WA8YOW). Special thanks to Harry, W8KKF, for letting OPDX know.....

PJ9, NETHERLANDS ATILLIES. Joe, K2YJL, and XYL Lynn, KE4WDZ, will be vacationing on Bonaire from October 4-8th. They expect to be active in the Ibero-Americana Contest on October 5-6th. Their efforts will be limited to 10 meters only with an HR-2510 feeding a extended double zepp. They will be using PJ9/K2YJL and possibly a PJ9 callsign for the contest.

SPECIAL EVENT STATIONS.....
From now until September 29th, look for special event station IY1EY to qualify for the "Loano Elettra Award" to celebrate Marconi's radioeletric experiments on the Elettra Ship from 1919 to 1936 in the Ligurian Sea. The special prefix IY1EY will be active on all modes (CW/SSB/RTTY) and bands. To receive a special QSL card reproducing Marconi's legendary boat "Elettra", QSL via IK1QBT.

The special event station CS5P will be active from the October 5-7th, on 80-10 meters. Operators will be CT1EXE, CT1EZI and CT1AXS. The station will be active to comemorate the day of The Portuguese Republic implantation. QSL to CT1AXS.

V2, ANTIGUA. Team Antigua is once again pleased to announce that it will be activating V26B in the upcoming CQWW SSB Contest in late October, 1996. They will be entering the contest as a Multi-Operator/Multi-transmitter catagory from the Beautiful Island Paradise called Antigua (Grid Square FK-97 -- IOTA NA-100). In addition, the Team would also like to announce that both the 5 band and 6 band "Certificates of Appreciation" will be available once again for the 1996 operation. To qualify for these special "Certificates of Appreciation", all you have to do is work V26B during the CQWW SSB Contest period on either 5 bands, or to receive the Special Certificate of Appreciation, 6 bands! Members of Team Antigua will also make special attempts to be active on the WARC Bands, RTTY, 160 meters, as well as some Satellites! The Members of Team Antigua and their QSL routes are as follows:
V26AK via Tony, WB2P : V26RN via Bob, KR2J
V26B via Sam, WT3Q : V26T via Dick, K3MQH
V26DX via Doug, KK3S : V26TS via Tyler, KF3P
V26E via Darrell, AB2E : V26U via Bill, WA2UDT
V26R via Mike, KA2AEV

Team Antigua would also like to welcome a new addition to its family, Charlie Harpole, K4VUD. Please QSL Charlie's future V2 call via his home call, K4VUD. Also, "Team Antigua" is pleased to announce the new address for their WWW page. The URL is:
http://www.frc.contest.org/v26b.html

XZ, MYANMAR. For those who are not on the "OPDX InterNet Subscribers Mailing List", Warren Hill, KF7AY, has announced in a press release that XZ1N will be active in November (The complete press release was sent to all subscribers!). Excerpts from the release state: "Thanks to the continuing efforts of several dedicated members of the DX community, the door to amateur radio in the Union of Myanmar has been re-opened! The stage is now set for a well organized, large-scale operation by members of the Central Arizona DX Association from November 16-25, 1996. This will be an all-mode operation and will even feature a special event station during the official opening ceremonies of "Visit Myanmar Year, 1996." Participants to be: AB6ZV, AA7WP, JA1BK, K5VT, KC5AYR, N6BT, WA6CDR, KF7AY, N7NG, N7WTU, NZ7E, OH2BH, WA7LNW and WY7K. Each operator brings unique skills to make this operation top notch. This activity has the approval of the Myanmar government at the highest levels and will conclude with a special multi-multi entry in the CQ World-Wide CW DX Contest. This week of intense activity from this extremely rare location will be a wonderful opportunity for everyone to work XZ in many ways! The crew will operate three Yaesu FT-1000MP's plus Alpha linears to monoband yagis at above 80 feet and various special low band antennas from the New World Inya Lake Hotel on the outskirts of the capital city of Yangon (96 deg 17 min E 16 deg 78 min N) formerly known as Rangoon. The main mode of operation will be CW, but there will also be extensive RTTY and SSB activity. Look for this team on the usual DX calling frequencies."
For more detailed information, you are invited to visit the XZ1N InterNet WEB site located at: http://www.getnet.com/~kf7ay/myanmar.html
Meanwhile, a later report indicates Martti, OH2BH, was in Myanamr

over the past weekend and was active as XZ2BH on 40 meters CW around 1800z. QSL via Martti's NEW address: Martti Laine, Nuottaniementie 3D20, 02230 Espoo, FINLAND

YK, SYRIA. Begin looking for YK1B next weekend to be activated by a large German group starting September 28th and ending October 7th. Details on this operation are very slim, but it was reported that this group will put an emphasis on 160 meters beginning on September 30th. QSLs to be sent via DL8HCZ.

All decent solder tips will be plated or clad with iron. Iron is insoluble in tin, copper will quickly dissolve when the iron wears away. So far as I know, virtually all tips will be copper base (conducts the heat) with iron cladding, then plated with nickel to permit tinning.

As far as the Wen tips, I'm not familiar with them, but there is a company called Plato who makes good tips for many types of irons. Check out:
http://www.marshall.com/pub/plx/sold/pgplx01a.htm
Marshall Industries is a good source for electronics production supplies, they will take a credit card order. OTOH, I have an almost unreasonable aversion to Radio Shack, myself.

I have a problem I own a 1968 Cherokee Six PA32-300 we have noise in the Airplane we
picked up. We have Pronouced "Click" we hear every few seconds at regular intervals.
It can be heard by the Nav/Com or DME Radios when everything is turned off but them and
it seems to be only occuring in the Air. Mostly Radio frequencies that end in .00;
.25; .50; or .75 seems to have the problem. I have King Nav/Coms and a Narco DME which I just got back from Narco trying to cure the problem.
Any and all Help would be appreciated.

I agree. Also, I think sugar is a better choice for "s". For non english
speaking people, the present "correct" phonetic can be confused for a
"c".

I have a "regular" segment on CHUO FM 89.1 U of Ottawa Community Radio
that features a focus on leisure activities people indulge in. I
would like to interview people who are into amateur radio. My show
will be about 15 mins, including a short interview. If your in the
Ottawa area, would you like to further your hobby and volunteer for an
interview? I'd like to interview people that have something a little
out of the ordinary to speak-on...something that our listeners would
find amusing. If you send in some text, instead of an interview, I'm
sure I might make use of your material. It's fun, I have fun
volunteering for this, and others would be interested in hearing what
you have to say. Please e-mail me at robbie@cyberus.ca
Thanks!, and hope to hear from you!
Robbie (ve3zzr)

3570. HOW TO GO FROM 30 --->40+ WPM ON CW?

gary@ke4zv.atl.ga.us (Gary Coffman) writes:
>VC mode, IE AX25 connected mode, basically duplicates the TCP transport
>function, and is usually just an undesirable overhead in a network where
>all switches support TCP/IP.

This is what we thought a few years ago. Unfortunately, we've since found out that it isn't true, and the 'connected mode' AX.25 has since proven to have advantages over datagram mode even when carrying TCP/IP traffic.

The reason is (in hindsight) simple - ALL of the TCP retry algorithms are end-to-end, and are nearly ALL predicated on the assumption that the network discards IP packets for only one reason: router congestion. TCP was simply not designed to efficiently operate in a lossy network.

Were there a reliable datagram version of AX.25, we wouldn't have to use connected mode. There isn't.

What is proving to be the better solution now is that point-to-point links (i.e., from your home station to the local switch, or station to station, or switch-to-switch) operate in a reliable mode - that is, connected (or VC - virtual circuit) mode, where the LINK takes care of packets lost to collisions, bursts of noise, low-flying ducks, whatever. TCP is then able to deal with end to end issues, router congestion, and other such problems.

This means that AX.25 links are aggressive in the face of lossy paths (which, considering the Bit Error Rate of most ham radio links, is nearly ALL paths), and do their damndest to get the IP packets from point to point. Our network switches are hardly ever congested, so there's very little packet loss for that reason. TCP then has only to deal with the occasional dropped or missequenced packet, and the gawdawful round trip times that our miserable network makes normal.

The result is a network that works a lot better than when we were running straight datagrams all the way.

There's some strong feeling that using PPP to frame the IP going over the connected-mode links would be an improvement - the headers aren't large and would contribute little overhead, and some of the option negotiation (including compression) would be a win. It's being experimented with now and maybe we'll see some results soon.
- Brian

3574. Re: Question for Carl and The No Code Group

In article <51kigl$ojq@krypto.zippo.com> cecilp@magic.bunt.com (Paul Cecil) writes:
>That to me is what the Code is all about, a hurdle over which the lazy
>can not pass. Only those who are willing to put forth the effort
>should become hams. If we take away the a Code then we need to replace
>it with another hurdle.

It isn't the government's legitimate place to erect arbitrary hurdles so that you can satisfy some hair shirt religionist work ethic. The government's legitimate concern is that we know what we need to know to operate safely and without causing harm to others. They rightly should not care how hard we "work" to satisfy those concerns. All that they should care about are results. And that's exactly as it should be. How hard one must work to meet amateur testing requirements should be irrelevant. Either you know what must be known, or you don't, and how hard you worked in the process doesn't matter.

Your fasination with "effort" is a basically religous concept of "earning salvation", but the Bible tells us you can't earn salvation, it can only be obtained through grace. Work for work's sake is valueless. Only results count. The management school credo today is "working smarter, not harder", and it is the path to success in any field. The ditch digger works *hard*, but the backhoe operator works smarter, and gets more done by the end of the day. Should he receive a lesser reward because he doesn't work as hard as the ditch digger? I would hope not.

Labor for labor's sake has no value. We sentence criminals to "hard labor", but that is out of vengence and not out of any real hope that good will come of it.

Some of the hardest working folks I know are bootleg CBers. They expend tons of "effort" hauling buckets of salt water in which to dip their ground leads, spend hours trimming the length of their coax for "best SWR", and other equally inane things. They work feverishly, but foolishly. They work *hard*, but their work is to no good purpose. Is that the sort of person you want in amateur radio, someone who will work very very hard, but accomplish very very little of any value because their *effort* is misdirected toward the wrong goal?

That's what the Morse test represents, a lot of expended effort to very little good purpose. There is simply no documented problem in regard to low Morse speeds on the air. If the government doesn't think low Morse speed merits enforcement action, why should it merit a test?

>Lastly, let remind all that a far greater threat lies over our
>"Hobby", and that is our own goverment. It needs money and is looking
>at all ways to get it. Even now pressure is being applied to sell our
>portions of the radio spectrum. Remember: UNITED WE STAND.

Remember more importantly that politicians count noses. In politics only two things count, money to buy votes, and grassroots numbers of one issue voters. Amateurs don't have that much lobbying money (though we should, where's the PAC ARRL?), so we darn sure better have the grassroots numbers if we want to protect our spectrum.

We may not care for CBers, and the government certainly wishes that they would go away, but do you really think the government would seriously consider reclaiming 27 MHz from several million CBers? Of course not. Politicians can count. Now we don't want amateur radio to become just a big CB band, but at the same time we don't want to be putting irrelevant makework hurdles in the path of those we would like to recruit into amateur radio.

Morse testing isn't what keeps amateur radio from becoming CB. *We* keep amateur radio from becoming CB, every day by the way we behave on the air and by the way we insist others behave on the air, most importantly by insisting that they tell us their true names.

CB is the way it is mainly because it is anonymous. Like members of a masked mob, CBers can act out their darkest fantasies on the air with little concern that they will be recognized. And it is socially acceptable for them to remain anonymous on CB. It is not acceptable in amateur radio, and that's the major difference between the services in regard to behavior. Amateurs are proud of their true names, and announce them frequently to the world, and insist those with which they talk do likewise. One of the few redeeming features of the postal card trading game is that it requires amateurs to furnish their names and addresses to those they contact.

>Let me end with these final thoughts::
>Robert Heinlein in his novel "Starship Troopers" said this -
>The American Constitution guarantees you the right to the pursuit of
>happiness, but no where does it guarantee you the right to succeed in
>your pursuit of it.

Right, no matter how hard you "work" or what arbitrary hurdles you may leap. If your energies are squandered toward irrelevant tasks, you won't be successful.

>And somewhere I remember being told that "that which is not earned but
>given freely away has no value."

The only things of real value are freely given, love, compassion, and understanding. (See, I can be just as sappy as you can.)

Remember that a license is a tool, and it is what the tool allows you to accomplish, today and tommorrow, that gives it value. What you did once to get it is irrelevant. A license is not a dusty trophy on a shelf, a rememberance of efforts once expended. It is a clean bright sharp tool that you use every day. Because it is a good tool, you take care of it and don't allow it to get rusty or dull. What it cost you once is unimportant, what it allows you to do today and tommorrow is.

>our children with behavioral problems, maybe a wee bit of psycotherapy
>would be in order.

If psychotherapy had a track record better than placebo, it might be worth a shot. But it doesn't. Electroshock or lobotomy can sometimes be useful tools to curb anti-social behavior, but the victim, err patient, usually isn't much good for anything after the treatment.

There are some promising psychoactive drugs becoming available which appear to really help some conditions, so we shouldn't give up hope that there may someday be real ways to deal with these problems. But a psychopath on drugs is a ticking time bomb. If he misses his medication just once, he could explode.

For now at least, if you can't reach a kid in twelve years, it's time to cut your losses before he terrorizes respectable society and all of us have to pay the costs. You could cage him like the vicious animal that he is for the rest of his life, but that wouldn't be humane. It's kinder to put him down.

We acknowledge the necessity of this with other ungovernable animals, but we get squeamish when those animals are our children. While that is understandable, it isn't reasonable.

Note: I'm certainly not advocating that we take our unruly kids out in the backyard and shoot them. We need to be sure everything possible is done to treat them first, and we shouldn't depend on just our judgement as to what should be done. But bad dogs only get one bite.

I agree. Also, I think sugar is a better choice for "s". For non english
speaking people, the present "correct" phonetic can be confused for a
"c".

>Actually Mike, SSB was in use on the transoceanic telephone lines as
>early as 1915 (recall the thread from several months ago). CW didn't
>get going until the early 20s.

If you're going to count wireline usage, then you've got to roll
CW back to 1837. Switched DC is continous wave (of zero frequency
of course). That sort of comparison is absurd. What we need to look
at, if we really care, is when the technology came into widespread
use on the air. CW came into widespread use in the 20s, and SSB came
into widespread use in the 50s.

More to the point, however, every form of radio today is CW. We
don't use damped waves for voice transmission or data transmission
either. What we're really talking about here is OOK Morse, and that
does date back to 1837. And we can then count SSB as a modulation
method which dates from 1915.

Even more to the point, the communications world is abandoning
OOK Morse wholesale in the 90s (actually, except for specialized
niches maintained mostly artificially by regulations, that trend
started in the 40s when most radio services started switching from
OOK Morse to voice and teleprinter), but the world is not yet
abandoning SSB.

>Lots of things that we still use today are much older than CW such as
>lightbulbs, telephones, automobiles, and airplanes.

Yep, but we don't see the world outside amateur radio abandoning
any of *those* things. When everyone else is out of step but you,
it might be time to review your cadence.

Unless you believe the rest of the communications world consists
only of idiots, and you are the only remaining defender of the
true faith, you have to consider that there may be good reason
to abandon CW, or more precisely, manual OOK Morse. And indeed

there is. Other methods can work at lower SNR, other methods have higher throughput and are error free, other methods don't get tired or sleepy, and other methods require less burdensome and time consuming operator conditioning to function.

Against that, you can only offer that OOK Morse transmitters are simple. Modern VLSI electronics has made that a moot point, and a FSK transmitter is basically identical to a OOK Morse transmitter anyway. If you can build one, you can build the other.

But, you say, you need an encoder and decoder to do FSK. Yes, you do, but you also need one to do manual OOK Morse. The difference is, almost anyone can learn to understand precisely how the FSK encoder and decoder work, but no one really understands how the OOK Morse encoder and decoder work. It's a black box, an unknown quantity, of extremely variable performance and dubious reliability. The specifications for the device are not consistent, there's no way to reliably calculate MTBF, no way to reliably determine system Eb/No or consistent throughput or error rates under specified conditions. Etc. It is a troublesome and inefficient part, which takes a long time to produce ready for shipment to the customer. It would be best if it were designed out of the system.

>realizable waveforms and equipments" ... OK??? (geeze ...)

No, because an unmodulated carrier is still narrower, and can still
use a narrower filter, than any modulated carrier, including OOK
modulation. Thus its detection threshold advantage still holds. Of
course the same holds for a finite but very broad signal with a
finite but very long correlation time correlator. This sort of
signal has an a priori known spreading sequence, but no unknown
modulation content to disrupt correlation. No coding you do to
the baseband data can beat either one of them for lowest detection
threshold.

Coding can enhance throughput for signals near the detection
threshold by lowering uncorrected errors, but it can't lower

the absolute detection threshold itself. Note, obviously some
detectors are better than others. Properly designed long
integration time detectors can always beat the human ear
for detecting unmodulated signals buried in noise.

>>>Properly coded signals can "combat" and "avoid" the noise by trading

>>
>>Coding gain doesn't help you if you can't detect the signal.
>
>Yes, Gary ... I didn't say anything about repealing the laws of nature

Apparently you did. See above. Coding cannot lower the detection
threshold, it can only improve throughput near the threshold.
That's pretty darn important in practical communications systems
of course, but it wasn't what you claimed. You can always detect
the unmodulated carrier at a lower level because it has maximum
redundancy. A modulated carrier has less redundancy because at
least one of its parameters has to change with the modulating
signal.

Hi Fred!

fred.mckenzie@spacecoast-bbs.com (FRED MCKENZIE) writes:

> How big a unit does the average home need? I suppose you could run
>almost everything with 5 or 6 KW. I decided that it would be better for

Just went 7 days without juice thanks to hurricane Fran. Apart from running the ham equipment, I want to be able to throw the main service panel breaker to separate me from the power company, throw another switch, pull the cord and have enough power to run lights and small appliances in the house. I know, how often do we live through a natural disaster? I've done three in 24 years. So on that count my plans seem a bit silly. But if I lived down near South Florida where you do, Fred, this would seem like a straight forward idea :-)

But now you know why I want more than a few hundred watts for the typical emergency power setup for the ham equipment. I'm going to tie the generator in with a switch at a point just after the house service panel 240v breaker that feeds the ham shack, incidently. This way I can throw that breaker and flip one more switch and have the whole shack on the generator with no extension cords or other fiddling. Gotta think up something failsafe in the way of procedures, though, like putting the generator motor's spark plug under the circuit breaker lever :-)

> Does anyone work in a muffler shop? I have heard of people adapting
>a small automotive muffler for use with a generator. I think this would

This is exactly the route I'm going. I feel certain that I can make the Coleman very quiet without robbing power. However:

This just in: There is a Coleman 4kw generator with a Honda engine! Got to hit Home Depot in the morning for chain link fence rails ($6.67 for 21 foot long galvanized steel tubes, one of the best deals on the planet). Will report what I find about this "hybrid".

Two notes about things that I suspect you are familiar with but others may find useful. Some generators have dinky 1-2 quart fuel tanks. Don't know what application they're intended for, but providing emergency power for a ham station or house isn't included :-) The (regular) Coleman 4kw contractor's generator runs 10 hours with its 5 gallon tank. I suspect the Honda OHV engine would run longer. Second thing is that folks need to be familiar with the fact that gasoline breaks down over time unless its treated with a stabilizer. I heard multiple stories during Field Day this year about neglected generators with engines completely gunked up because of old gas. I'm told places like K-Mart sell stabilizer.

My wife and I ate for a week with a Coleman camp stove, incidently. I'm very fond of that brand at the moment :-)

Regards,
Pete

BANDWIDTH. The Internet is High-Speed, High-Capacity meganetwork that
carries thousands of newsgroups with a few million users on the net at
the same time during peak traffic. Technically not possible in the
limited spectrum space of ALL amateur radio bands up to X-band combined.

The "cellular phone industry" isn't planning on sending the Internet via
cell site repeaters but the telecommunications industry wants to offer
it via very high speed data over optical fiber drops to subscribers.

The Internet is essentially a Common Carrier service. Under all the FCC
R&R domain, amateur radio ain't allowed to do that because it isn't a
Common Carrier service.

The present 'official' phonetic alphabet is based on the NATO phonetic
alphabet adopted by the U.S. military in 1955. The International Civil
Aviation Organization (English being the airways international language)
adopted it shortly thereafter. Its development was largely by Test of
comprehensibility by native-language speakers/listeners of NATO member
countries. It works with most of the other _European_ alphabetic-based
languages but is some problem with variants such as Cyrillic. It works
not at all with syllabic-based languages unless the speaker/listener
also knows one of the alphabetic-base languages.

You might have your friend call Ramsey if he does have one of the early
FM 10's. Ramsey offered a upgrade kit at no cost at one time for these
early units. I had one and although I did not have the problems with
the stereo pilot like your friend, I did have a lot of noise that the
crystal mod cleared up.
Ramsey also offers a processor now for their stereo units. Unfortunatly
I cannot offer much info on how well it works.

Cross-posted to: rec.travel.air,alt.radio.scanner,rec.radio.scanner,rec.radio.shortwave,rec.radio.amateur.misc,rec.aviation.piloting

has anyone traveled domestically (US) or Internationally with electronic equipement and experienced any security delays related to the toys you were traveling with.

I usually travel with a shortwave radio (SONY-2010), I also take along a hand held scanner (either Regency HX-1000 or AOR-1000) to listen to the action in the air and around where I'm going.

I have been able to give everyone a heads up on glight delays based on what I was hearing on my scanner..either weather, mechanical, or ATC flow control delays.

also, when I am driving, the scanner gives me real-time road information. If I hear a police or fire dispatch or a chase on the scanner, I know to plan for an altenate route. Beside police and fire, I can scan all the radio traffic reports they commonly use frequencies in the 450-451mhz area Airline operations frequencies are usually in the 128.0-132.0 mhz(AM) and 460.6-461 mhz (NFM) area. At some airports, a trunked 800mhz system operated by ARINC may also be in use.

In Germany, I did have a brief delay..they wanted to know how the SONY-2010 worked. I explained...they also used a sniffer to check for anyh traces of nitrates (explosives) I did have aproblem with the scanner that I had in a pouch on my belt...Airport security (Police) wanted to know what i was doing with the scanner. I showed them my frequency lists..all were for Police, fire, and aviation frequencies in either Arizona or Southern California.....Finally, I was able to get the scannerhome by letting the plane's captian agree to carry it in a special pouch.

Source record: 216494
Cross-posted to: rec.radio.amateur.misc,rec.radio.digital.misc

Has anybody found a program which can read a latitude/longitude file list
of cities and identify all cities within a specified radius? I know that
one way to do this would be to use maps, but sometimes maps don't list
all of the cities that might be listed in a large datafile.
I have solved a very similar problem in the past and used a "gridsearch"
algorithm to speed up the search speed, but I am not really setup to do
programming right now (nor do I really have the time).

Ideally, this could be a feature added to a computerized repeater directory.

Gee, you try to find one bad line in Gary's great post, and you screw
that up. Notice "arbitrary"? My dictionary states "based on preference
rather than necessity". A written test is a necessity for safety.
A CW test is purely arbitrary. Gary was referring to the CW test, not
the written tests.

Actually Gary, as I pointed out to Jeff in my reply to his rediculous
comment, ALOHA was developed at the U of Hawaii and first used to link
computers between the islands on a UHF link ... seems to me the first
CPUs were PDP-8s if memory serves me correctly.

Jeff either:

a) is compeletely unaware of the history of wireless digital networking,

or

b) trolling again, since HIS domain is <hawaii.edu>

I'm not sure which of the above I'd put my money on, but past history
causes me to lean towards "a" ...

Yes we are trying to keep people out! Your call for more technically
minded people will keep out those who are not. If they don't have the
knowledge they don't get in. And those who have to study all the
electronic theory just to get a license will consider the test a
"hurdle". Especially if they never intend to use the knowledge outside
the amateur radio hobby.

>>Finally, Carl. After reading your responses I think I know you. We are

Read what you have written, you want eveyone to have the same
knowledge base as you. Therefore, they must be like you.
>>
>>Do not devalue our Ham License by giving it away, Please.
>>

>Paul ... nobody is talking about giving it away ... I've advocated
>tougher technical tests across the board ... we just want to modrnize
>and eliminate an obsolete requirement that doesn't fit today's world.

You have talked about tougher tests. Would please give me an idea of
what type of test a new ham would take. Give some example questions,
topics a ham would be required to know, etc.

>We have more to fear from the governent if we're perceived as
>technically backward (which we are, as a service) than from a bit of
>bickering amongst ourselves over change ...

Actually, I don't think the goverment is worried about our technical knowledge. But they will become concerned if the code is dropped as a requirement since they will then have to listen to this thread in person.

One license, one class?? I live in Germany currently and they only
have 3 classes. Class A - the same as our Tech - Plus, Class B - Full
HF privaleges, and Class C - no code. This seems to work OK.

>"work to be Hams are Hams"? What's that mean? Whether someone

I can answer all of the above by saying YES, anything that you have to
work for , that you have to earn, that you struggled for has value.

Here, I reward you an Olympic Gold Medal for the 100 meter race. Does it have value to you beyond the metal. If you practiced and earned it, yes. My use of the word "hurdle" was meant as a figurtive object that stands in ones way to accomplishing a goal. For me, the tests were nothing. But on the other hand the Code I had to struggle through. When I passed my code test I was elated. I had accomplished that which I set out to do. No it did not neccessarly make me a better person, but I sure felt good.

>serve that purpose well at all.

I have no qualms about doing away with the code as a requirement. But I have yet to hear of an alternative approach of testing except for making the test harder. OK... tell me about it. Give me examples, show me what knowledge will be required, etc. I believe this is what is upsetting the pro-coders. The no-coders keep implying that knowing the code means being ignorant. Whether that is what was meant, that is what comes across.

>>Finally, Carl. After reading your responses I think I know you. We are

>>technology.

>No argument with the above, but what does it say... for or against
>continued CW testing for HF access?

Nothing, except that a majority of hams wwould rather enjoy the hobby side of amateur radio (ragchew, dxing, contesting, etc.), not the experimental side. Carl (to me) seems to suggest that amateur radio should only be an experimental hobby. I almost think that he wants to do away with all else. (i.e. If you are not testing something then stay off the air). While this has nothing to do with the cw argument, it has alot to do with what direction we wish to see our community grow in the future. With the elimination of cw as a requirement to operating on the hf bands (Yes I do believe it is coming), we the individuals of our community need to start thinking about what will come next.

>>Lastly, let remind all that a far greater threat lies over our
>>"Hobby", and that is our own goverment. It needs money and is looking
>>at all ways to get it. Even now pressure is being applied to sell our
>>portions of the radio spectrum. Remember: UNITED WE STAND.

>Which, like it or not, says the more of us, the better our
>ability to press our case. Yes, there is a value in pure
>numerical size.

But is size what we want. Are the hf bands empty? How about the vhf bands? Size is not all. It is how we use what we have. The ARRL needs to start lobbying the companies to start bring out equipment for the uhf and microwave bands that we all can afford. Look in the catalogs, how many low priced all modes do you see for vhf on up?

>>Let me end with these final thoughts::
>>Robert Heinlein in his novel "Starship Troopers" said this -
>>The American Constitution guarantees you the right to the pursuit of
>>happiness, but no where does it guarantee you the right to succeed in
>>your pursuit of it.

>Your point?

My point is that there will always be those that will cry, whine and gripe because they could not, and should not, have their way. In this age and day, to many individuals think that whatever they want is their God given right to have. No where is there a guarantee that simply because you want an amateur radio license, that you can get it. You have to take a test and prove your knowledge. If we make the test harder then there will be those who cry foul because "they don't use that garbage in their everyday life so why should they learn it!"

>>And somewhere I remember being told that "that which is not earned but
>>given freely away has no value."

>No one is asking for a license to be freely given away.

>>Do not devalue our Ham License by giving it away, Please.

>Again, no one is suggesting giving ham licenses away.

I am just reminding everyone of it.

Jerry,
You said:

The exposure I got on the net to the very rabid pro code folks A.K.A
Code Nazis has comptletely changed that.

However, I assumed that you were talking about the exteremists.
Exteremists always talk louder then everyone else and usually drown
out the moderate people. Who actually make up the majority. In this
case we hear the exteremists from both sides and they are loud. It is
going to take those of us "moderates" to bring some sense to this
disarray and reach a common ground. That common ground is the insured
growth and health of our hobby.

Ending the Code will not end the crisis we are entering. Carl and
others advacate harder tests, is that an answer? Will harder tests
make our hobby better. I work with many officers in the Air Force and
I can tell I ahve seen a few with PhD's that make me wonder how they
became officers. No, harder tests by itself is not answer, and I
personnaly believe will lead only to a technically elite class with in
our community who will look down on the "old fartz".

While open debates are good, it must also be constructive. This debate
is not constructive. But must become one.

If have not seen it, please read me responce in the thread "To Carl
and the No-Coders". It says what I feel.

Carl,
My thoughts are similiar except that I do not consider the code a pain
in the ass, just in the fingers :) I too found the theory easy.
However I work in the electronic field and so it should be easy. The
code made me work for my license and gave me a sense of accomplishment
when I passed it.

I am trying to keep a clear and open mind. I accept the fact the fact that within 10 years we will not see the Code as a requirement for hf privilages. My question is where will we go? And don't just say harder tests, there is more to it then that.

There are many people (usually those for whom, as you say, "Cost is NOT
and isssue ...") who always buy the "latest and greatest". Then there
are those who realize that, OFTEN, the "latest and greatest" is just a
rehash of last year's model with some modest, incremental improvements
and a new arrangement of buzz-words.

>frequency spectrum center frequency of you spread spectrum signal, a la
>homodyning).
>
>I venture your spread spectrum signal at 900 mHz exceeds the bandwidth
>of any of the nine amateur HF bands.
>

First, let me state that the width of the signal in my particular application does not have any bearing on whether the same techniques or similar techniques are usable in HF gear ...

Actually, the (spread) bandwidth of the signal (in the system I mentioned) is 1.92MHz (null-null), so the (folded, I/Q) baseband bandwidth is 960kHz ... the mix to baseband does NOT despread the signal ... that's done digitally in an ASIC (which presently costs $13 and change ... that cost will likely be 1/2 in a year) ... Remember, this system will RETAIL for $299 ... and that includes two (2) complete radios (a complete link) ... doesn't sound like the cost (of the underlying technology) is so exorbitant as to be out of reach to hams to me ...

>Now, how does your information bandwidth at baseband compare with
>the required info bandwidth that is useful at amateur HF band frequencies?
>Amateurs bandwidths are VERY narrow: RTTY 250 Hz for example,
>PACTOR, etc somewhat wider. I have used 50 Hz bandwidth on CW
>using the Comsoft Softwave DSPreceiver (not mentioned above, but built
>into my Gateway Pentioum PC90, using an external RF box.) No
>crystal filters involved, by the way.
>

The information content in this particular system is a 32kbps ADPCM stream, sent as 64kbps data bursts (spread with a 960kbps chipping code) (the system is TDD ... that's Time Division Duplex, where both ends of the link alternate the use of the same channel in a way that "looks like" a full-duplex link.)

Your last question presupposes the current amateur thinking that "narrower is better" ... which is not actually an axiom ... more like a "conventional wisdom" ... and conventional wisdom usually fails when progress shows up at the doorstep ...

Besides, there is nothing inherent in the underlying techniques that I've alluded to that would preclude them from efficiently carrying low rate data streams such as RTTY and "CW" ... as I said ... why not digitize the keying on the straight key in a far more efficient manner and transmit the data as a high rate burst ... then mutiple users could share the same channels without interfering with each other ... (I even postulated a means for artifically increasing the QRM level for those who whish to challenge the abilities of their "wetware modems" and for contests, etc.)

When you come right down to it, the main thing implied by lower rate source data is the ability to achieve higher processing gains in a given bandwidth ...

Pete Soper wrote:
> This just in: There is a Coleman 4kw generator with a Honda engine! Got to hit

I have two of the units described above. They are a *lot* quieter than the Briggs or Kohler engines. I ran one for 5 days two winters ago, connected in through the house main (disconnected service). It ran about 12 to 14 hours on a 5 gallon tank, depending on the load. I am really pleased with mine, went out and bought a second one for my dad. I also ran mine dily when I built my house, so no problems whatsoever over about 1800 hours of use on my first one.

I suggest you do the switchover right, disconnecting *all* circuits between house and the pole, including the neutral. The National Electric Code Book has quite a bit to say about this, and insurance companies are starting to consult the NEC in liability cases that might arise due to improper use of a generator. You might consult with the power company for proper procedures and equipment.

Our Explorer Post has several generators, most powered by Briggs, and NOISY. I purchased a "universal import car muffler" and built a frame to mount it on. The Exhaust is nearly silent, but the air cooled engine is still too noisy for use around people. Between the blower noise, and the rattle of the engine, it just isn't something that will make friends.

Suggestion: Purchase 2 pullout in service disconnects, the kind that
have 2 fuses in a pull out holder. Wire the top of one to your
commercial power source, and the top of the other to your generator.
LOOSE one of the pullouts! With just one pullout left, you can use it to
close the circuit of your choice.

I've offered /'keI bEk/, /'kE bEk/, even /'k@ bEk/. This of course is
with a midwesterny-Californian American English "accent".

For those unfamiliar with the version of the IPA we use here on a.u.e,
here's a translation:

[eI] is the "ei" in "eight".
[E] is the "e" in "end".
[@] is the schwa, the "u" in "but".

To this, there is the "w" pronunciation, /'kw@ bEk/ or /'kweI bek/,
and (probably) the one everyone will stigmatize, /'kwi bek/ ([i] is
"long e", as in "queen"), wherever the stress is put.

I notice with myself at least that both syllables are stressed
approximately the same, and if there really is stress, it's a small
one on the first syllable.

For myself, /'kE bEk/ seems closest to what I do, roughly "keh-beck",
with the first vowel being that in "Ken", "keg", or "kept".
--
Mark Odegard odegard@ptel.net
The great orthographical contest has long subsisted between
etymology and pronunciation. It has been demanded, on one hand,
that men should write as they speak; but, as it has been shown
that this conformity never was attained in any language, and
that it is not more easy to persuade men to agree exactly in
speaking than in writing, it may be asked, with equal propriety,
why men do not rather speak as they write.
-- Samuel Johnson, "The Plan of an English Dictionary" (1747).

Thanks for the note. Got another one by direct mail.

I was entirely too casual with my last posting. It is the case that tying a generator into your house wiring without disconnecting from the power company feed could electrocute a power company person trying to fix wiring outside the house. Please disregard my last posting.

The Coleman 4k generator with Honda engine is $900 in this area (Raleigh, NC).

Regards,
Pete

Flame away?? wow, you must think much of yourself.

Carl and I are best bud's. we watch out for each other. He's teaching me
to copy 20 wpm in my head.

Besides I only offer these services for those who profess a superior intellect and then
make
bone head mistakes like constantly spelling the same word(s) incorrectly
And only those who profess to an amateur radio type of
welfare state, where you can get a license by putting nothing into it.
I have no problem with the code tests. It makes someone work for something
that they want. I don't think you qualify though.

OHHH i'm sorry, we already have that don't we?? Isn't it called CeeBee??
Well 10-4 there good buddy. Picked this here HF ray did e oh from that
there 76 truckstop. How'm i sounding?? how bout that radio check.
Roger dee doger there

Glad to see you've come out from under your rock again.

3616. Question: 1/4 wave vertical antenna length

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-23 00:00:00 UTC
From: "dupuis@freenet.edmonton.ab.ca" <dupuis@freenet.edmonton.ab.ca>
Message-ID: <52501a$bei@rover.ucs.ualberta.ca>
Source record: 216262

This should be a simple question, sorry for the post...

The ARRL guide gives a formula of Length(feet)=234/Freq(mhz). For 27.2 Mhz, this would give a 1/4 wave vertical length of 103.1 inches.

I've always thought that 27Mhz 1/4 wave would be about 108 inches, and this is confirmed from formula = (speed of light/freq)= wavelenghth, or (300,000KM-s/27.2MHz)=11.1Meters or 108inches at 1/4 wavelength.

Why is there a difference?

Right on Mark! I've done some travelling myself. I did not do a solo
boat trip however but that would have been fun.

Heck, long before us younger folks were involved in a lot more
adventers than we'll ever know. Before we know it, in the near future
anyone under 30 doing anything like this will be considered too young.

There are those who do it, those who wish they could do it, and those
who are resigned to never to do it...and they're the ones badmouthing
it.

The attempt to emulate the CSMA/CD of Ethernet does not work very well
in practice. The CD (Collision Detect) is not even attempted due to
simplex radios. In Ethernet, the collision is immediately detected and
the random wait can start immediately. In AX.25, you have to wait for
the timeout of the missing Ack. The CS (Carrier Sense) part does not
work very well due to the hidden transmitter problem, thus, the access
control part falls apart very badly. I tried to introduce some simple
questions about the hidden transmitter problem into the Novice and
Communicator class question pool, which is under construction here in
Finland, but the questions were rejected as too complicated :-)

>2) It provides the leading flags needed to synchronize the HDLC clocks.

>3) It provides the Txd to handle transmitter and receiver settling times.

The Txd and the lack of real collision detect drastically drops the
throughput of a channel.

>4) It provides a way to avoid repeated collisions through its p-persist
> and slottime parameters.

If all stations could hear each other.

>5) It provides the hardware addresses in its header to which logical

>It does more things as well, but that's a good start. AX25 plays the
>same role over radio that MAC plays over ethernet. And for the same
>reason, because they both use shared resources.

Unfortunately the propagation medium in Ethernet is well defined but
the propagation medium in packet radio is not. Protocols that work
well in Ethernet does not necessarely do so in packet radio.

>If you are using a
>non-contending point to point link, like a leased (or dial up after
>call setup is completed) phone line, or a duplex radio link on an
>exclusive frequency, then you don't need much of a MAC layer at all.

The "X.25" part of AX.25 works well as long as the transmission medium
is similar, i.e. _full_ duplex point to point with (relatively) low
bit error rate. IMHO, AX.25 should be reserved for trunk lines.

>But if you are sharing the channel with other stations, you must
>have something like AX25 to permit it to work.

I guess that many existing networks would work as well (or as badly)
as a simple Aloha type system without any access control :-)

Paul OH3LWR

3621. Question about the sequential callsign system

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-23 00:00:00 UTC
From: jlowman@netcom.com
Message-ID: <jlowmanDy6JF9.4Mv@netcom.com>
Source record: 216267

It wasn't entirely clear from the information sheet that accompanied the vanity callsign application, whether one could request *any* callsign (other than the "prohibited" ones, of course) that is appropriate from those callsigns allocated to the US.

I have held an Advanced class ticket since that class was born, in 1968. My original callsign was WA8RWL, in Michigan. Since I have lived in California since 1975, I would be interested in a "6" callsign that indicates my tenure as an Advanced operator.

Because I felt that existing amateurs who had
already qualified for full band privileges as a General should have been "grandfathered" when Incentive Licensing began, I discontinued my membership with ARRL at that point. Nearly thirty years later I rejoined, primarily as a convenient way to receive QST Magazine. As a result, I missed out on the opportunity to learn that I could get a 2x2 callsign.

Now, the KA#xx format was available only to hams in the first area (the New England states) originally, and KC6xx callsigns were assigned to the Caroline Islands.

My question: can I apply for a KA6xx 2x2 callsign under the auspices of the vanity callsign program (KA6CR, for example) that recoginzes my longevity as the holder of an Advanced class license in California, even though KA6xx callsigns were never available here? I'd like to get K6CR once I pass my 20-wpm code exam (I passed the Extra theory on Saturday) but that's farther back than I'm really entitled, and surely all of the 1x2 callsigns will be consumed today, when gate 2 opens.

Any advice will be welcome.

73 de Jim - KF6CR (actually, a fairly old callsign, since KQ6xx is being issued currently)

This may be a mite late.....

A friend of mine tried to file his 610-V electronically earlier this morning. The problem is that he only has a text-based system through a dial-up shell account. He reports that this did not work and will have to make arrangements to use someone else's system that has the appropriate capabilities.

So, be advised: If you have not sent your form 610-V by mail/courier and are planning on filing electronically and do not have these advanced capabilities you may want to make arrangements to use a system that does.

Otherwise, you may be S.O.L.!

I'm sure glad I spent the $10.75 to send mine by Express Mail on Saturday. It was delivered at 11:00 AM yesterday morning. Now, the waiting begins!

A.N.A.R.T.S. News Bulletin 927 22 SEPTEMBER 1996

Cols Column.

I had intended this week to bring you some more on the subject
of early communications. However, the report on our RTTY contest
results is much more important, so here it is, from Jim VK2BQS.
Jim has sent me the new contest rules, which reflect the changes
made regarding certificates for Continents and 5 World placings.
One last thing, I will put a copy of the new rules on to the
Packet system after the cast this Sunday, watch out for that.
All contestants in this years contest will receive a copy in the
mail. cheers for now De Col VK2CTD.

REPORT ON ANARTS WW DX RTTY CONTEST 1996.

Preliminary Results Issued 14th September 1996.

PLAQUE WINNERS for FIRST PLACES in WORLD.

Classification A : Single Operator UT0I 4,198,658 pts

Classification B : Multi-Operator'S RK9CWA 5,389,360 pts

Classification C : S.W.L's ONL083 271,065 pts

CERTIFICATE WINNERS for 1st to 5th Places in WORLD.

Posn.	Class A.	Class B.	Class C.
1.	UT0I 4,198,658pts	RK9CWA 5,389,360pts	ONL383 271,065pts
2.	UR7E 3,346,276	AA5AU 3,965,922	ONL3997 11,424
3.	VK2KM 3,319,422	IK2BUF 2,816,144	-
4.	AB5KD 3,286,828	OH0JWH 2,558,460	-
5.	UN5PR 2,622,592	VK6GOM 2,082,785	-

CERTIFICATE WINNERS for 1st to 3rd Places in EACH CONTINENT.

CLASS	Posn.	NA	SA	EU	AS	OC	(AF)
A	1.	AB5KD	CE8SFG	UT0I	UN5PR	VK2KM	-
	2.	N1RCT	-	UR7E	RA0FU	ZL2JON	-
	3.	WA6VZI/7	-	UA4LL	4X6UO	VK5AI	-
B	1.	AA5AU	-	IK2BUF	RK9CWA	VK6GOM	-
	2.	VE3FJB	-	OH0JWH	-	-	-
C	1.	-	-	ONL383	-	-	-
	2.	-	-	ONL3997	-	-	-

Certificates for COUNTRY/MULTIPLIER Placegetters will be advised in the final Official Results which will be distributed to all contestants and will include comprehensive point scores as is our usual practice.

It will be noted that an additional area of Awards have been created for this year to recognise placings in Continents and also to extend the 'World' placings to five. This action was taken in reponse to a suggestion received from Ron, AB5KD, and it is hoped our contestants agree that it is a worthwhile change.

There is still much work to be done before the Full Results are published and the various Awards distributed, so please be patient.

WEEKLY SOLAR AND GEOPHYSICAL REPORT

(13 SEPTEMBER - 19 SEPTEMBER

ISSUED ON 20 SEPTEMBER 1996

SUMMARY
Date 13 14 15 16 17 18 19
10cm 67 67 66 68 69 69 69
A 14 12 15 18 8 17 (10 estimated)
T 2 -2 -4 -3 -7 1 -8

SOLAR ACTIVITY WAS VERY LOW ALL WEEK.

THE GEOMAGNETIC FIELD AT LEARMONTH W.A. WAS QUIET TO UNSETTLED 13TH 60 15TH AND 17TH SEPTEMBER; QUIET TO ACTIVE 16TH; AND UNSETTLED TO ACTIVE 18TH TO 19TH.

MAXIMUM USABLE FREQUENCIES AT SYDNEY WERE MOSTLY NEAR PREDICTED MONTHLY VALUES, WITH DEPRESSED PERIODS TO 30 PER CENT 17TH TO 19TH SEPTEMBER.

FORECAST (20 SEPTEMBER - 26 SEPTEMBER)

GEOMAGNETIC: MOSTLY UNSETTLED TO ACTIVE, WITH A POSSIBILITY OF MINOR STORM BETWEEN 24TH TO 25TH SEPTEMBER.

FREQUENCIES: HF CONDITIONS AT HIGH LATITUDES ARE EXPECTED TO DEGRADE.

COURTESY OF IPS RADIO AND SPACE SERVICES

Notes of Interest:
The KYFC Department:
Peter, ON6TT/5X1T reports that the Heard Island Dxpedition team will land on Crozet for about one day, and on Kerguelen for perhaps two days. He promises to make RTTY ome of his priorities.

Arie, 4X6UO, who closely observes the goimgs on at the ITU in Geneva, says he is confident that amateur radio in Palestine and Gaza strip+Jericho will be legalized, with a new ITU designated prefix, at the beginning of 1997. Arie reminds us that ZC6 is not a currently recognized prefix for this area.

The VK2SG RTTY DX NOTES are also available on Internet at reflector digital-dx(at)st.rim.or.jp . See also the OH2BUA Webcluster at URL http://www.clinet.fi/jukka/webcluster.html .

For next week's bulletin, send your bandpass and notes of interest to Luciano, I5FLN at ZS5S.ZQAF.AF

ARLD042 DX NEWS

THIS WEEKS BULLETIN WAS MADE POSSIBLE WITH INFO PROVIDED BY MAURO, I1JQJ, THE 425 DX NEWS, CHRIS, G4BUE, THE DX NEWS SHEET, THE YANKEE CLIPPER CONTEST CLUB PACKETCLUSTER NETWORK AND CONTEST CORRAL FROM QST. THANKS TO ALL.

HRANEK, YT1AD WILL PARTICIPATE IN THE CQWW SSB CONTEST OCTOBER 26 AND 27 FROM 3V8AA ON 10 THROUGH 160 METERS. BEFORE AND AFTER THE CONTEST HE WILL BE ACTIVE ON CW ON THE NEWER BANDS. QSL VIA YT1AD.

UGANDA, 5X. PETER, ON6TT WILL BE ACTIVE AGAIN, INCLUDING 160 AND 80 METERS, AS 5X1T, STARTING SEPTEMBER 7. QSL VIA ON5NT.

BARBADOS, 8P. FROM NOVEMBER 15 TO 22, JOHN, K4BAI WILL BE ACTIVE AS 8P9HT.

REUNION ISLAND, FR. JON, EA2KL, AND LUIS, EA3ELM, WILL BE ON THE AIR FROM NOVEMBER 6 TO 12, SIGNING FR/ THEIR HOME CALLS.

JORDAN, JY. LOOK FOR BOB, WB9YXY, AS JY8XY FROM OCTOBER 1 TO 20. OPERATIONS WILL TAKE PLACE MAINLY ON CW, FROM 10 TO 80 METERS. QSL VIA HOME CALL.

MARTIM VAZ ISLAND, PY0. PT2NP, PT2GTI AND PT2HF WILL BEGIN OPERATIONS AFTER THE FIRST WEEK OF OCTOBER USING THE CALLS ZV0M AND ZV0MV. QSL VIA PT WDX, ABRA-DX BRAZILIAN ASSOCIATION, P.O. BOX 09647, BRASILIA (DF), 70001-970, BRAZIL, OR PT2GTI.

CENTRAL AFRICA, TL. TL8MS IS ACTIVE AGAIN. QSL VIA DL6NW.

ANTIGUA, V2. STEVE, WF2S, WILL BE ACTIVE SEPTEMBER 22 TO 28 AS V26Z. OPERATIONS WILL TAKE PLACE MAINLY ON 20 AND 17 METERS CW. QSL VIA HOME CALL.

NIGERIA, 5N. ALFRED, DJ0KN/5N3ALE IS QRV UNTIL THE END OF SEPTEMBER AS 5N4ALE FROM BONNY ISLAND. HE LIKES NETS AND IS OFTEN ON THE BRAZILIAN YL DX NET BETWEEN 1930 AND 2100Z

WEDNESDAYS ON 14248 KHZ. QSL TO HOME CALL.

MALTA, 9H. 9H3WD AND 9H3WM WILL BE QRV SEPTEMBER 21 TO 28 FROM COMINO ISLAND. LOOK FOR THEIR CW ON 1825 KHZ ANDV3 KHZ UP FROM THE BAND EDGE AND SSB ON 1845, 3780, 7060, 14260, 21260 AND 28480. QSL VIA OK1AD.

URUGUAY, CX. CLAUDIO, LU7DW, IS TRYING TO OBTAIN PERMISSION TO BE QRV AS CX/LU7DW FROM TIMOTEO DOMINGUEZ ISLAND AT THE END OF SEPTEMBER OR BEGINNING OF OCTOBER.

COMOROS, D6. MAIKE, DL4XS, MIRKO, DL6ET AND DIETER, DL3KDV WILL BE QRV FOR ANOTHER WEEK AS D68XS, D68ET AND D68DV AFTER CANCELLING THEIR FH OPERATION. QSL VIA DL4XS.

COMING EVENTS

SEPTEMBER 28TH-29TH CQ/DJ WW DIGITAL

OCTOBER 19TH-20TH JARTS WW RTTY

Hi
Is there a WEB site that lists schedules for Ham Fest through the United States?

I'm looking for dates for Ham Fest in the SouthEastern PA area. I know of one that is held in York, PA but I can't remember what part of the year it is (I thought fall time) So if anyone knows the dates please respond.
Thanks,
George

I can't say I've undergone any extensive delays. Anymore, most places
do want me to fire up my laptop and show that it can do something.

Leaving Aberdeen, Scotland a couple of weeks ago I was subjected to
the most intensive scrutiny I've ever seen. Though quite cordial, the
security officer asked me to light up every little item in my
briefcase: pocket calculator, battery-operated shaver, mini-maglight,
and of course the computer. The he found my "hushers" (Noisebuster
head cancelling headsets.) He asked how those worked and I explained
that if we wanted me to show him he would need to put them on. He
did, and I fired them up. When they went into operation, he responded
"Brilliant!" and sent me on my way.

>Any and all help and suggestions would be appreciated.

From your description I would deduce the following:

1. The most likely thing is some electrical device that isswitched on
and off automatically.
Try turning of the strobe lights or rotating beacon.
Also make sure the electric fuel pump is off.
Try turning off the transponder and see if it goes away.
If none of that works turn off the master and see if it goes away.

2. Another possible cause is a problem in the audio panel.
(Am assuming that the radios are ok)

>
>Why is there a difference?

End effect. That causes about a 5% shortening of the element compared
to the free space wavelength/4. When the field reaches the end of the
element, it doesn't stop there. It extends out into space a bit before
returning. So the element's physical length will be a bit shorter than
its electrical length. (That's a simplistic explanation, but is useful
for visualization. What really happens is a loading effect due to end
capacitance, but the result is the same, the field energy is stored in
the end capacitance for a moment, and that's equivalent to a greater
electrical length.)

Jim,

Why is it that I would have to beg for HF priviledges? Can't I just turn on my Icom and HL2200 and have at it? Explain I am confused. Have I missed something? Please explain to poor grasshopper.

Jerry

Correct me if I'm wrong but I believe a troll is a "small green ugly creature, demonish in character, which habitates under bridges and/or crossings and plays tricks in the same pattern as poltergeists." I think.

They are about 3 feet tall and the figment of someone's imagination.

> JOHN

Two weeks ago I traveled round trip between JFK and Rome on TWA. My
Uniden scanner was in my briefcase and my Grundig YB400 was in my
carry-on garment bag.

Neither radio raised any eyebrows in either airport. Both bags went
through x-rays and were not hand checked.

As a precaution, I carry the owners manuals for the radios as well as a
copy of my amateur operators licence when I travel with my radios.

In the past, I have traveled domestically with my HTX-202, again with no problems.

I hope this helps you,

73,

John, KB2YJH

Postal addresses (from which most of these databases calculate your address) do not always accurately indicate your county of residence, especially in rural areas. In some cases, your postal address may not even reflect the correct state. I recall a fellow whose postal address was Arizona, but who actually resided on a rural route in New Mexico.

Don't know much about piston aircraft but...
Jets can get this type of interference from "p-static", that is, static electricity that is built up on the surface of the aircraft as it moves through the air. The "click" occurs when an electrical discharge (spark) occurs. This discharge can occur between two poorly bonded sections of aircraft or between the aircraft and the surrounding air. Static wicks on the trailing edge of the aircraft surfaces are the usual solution to the latter type of discharge.

This phenomena occurs only in certain type of weather conditions.
Maybe someone can clarify if this happens with aircraft of this size.

Bob

International Callsigns for US Navy ships are contained
in a publication (ACP 113?) not likely to be available to
the public.

These calls (4-letters starting with "N") are not
used exclusively only on CW, but on digital circuits
and also visually. In fact, they are displayed via
signal flags when entering or leaving port.

In the case of ships which are named after people, the
callsigns frequently include the initials of that
person, for example USS F. D. Roosevelt = NFDR,
USS John F. Kennedy = NJFK, USS Forrestal = NJVF.

Just a mite curious, but your note is dated 23-Sep-96. If your package
was delivered "yesterday", that means it was delivered on a Sunday? I
wasn't aware that Express Mail had Sunday delivery.

Also, didn't the FCC state that requests received before the 23rd would
be returned to the sender? In that case, if yours was delivered yesterday,
wouldn't it be returned to you?

>fuel right away.

I think we need to define that "long" period of time.
I have sucessfully stored gasoline for a year. Besides,I would
certainly hope the owner wouldn't just let the generator sit
idle.

Generators need to be tested routinely, an emergency isn't
the time to figure out if it is going to fire up or not.

I don't think the storage issue is really a problem here,
unless the unit were going to sit for more than a year. If so,
other things need to be done to the engine anyway
to prepare it for storage, which includes draining out any
fuel.

Anyone properly prepared will have fresh fuel available,
this should be included in their disaster planning. Being
ready for something isn't seasonal.

>Diesel can be gotten from any long haul truck,

I can't see these guys giving up any of their fuel when they are
expected to haul much needed items into a disaster area, get out
and deliver more ASAP.

>or from farm equipment, or heavy equipment.

Farm equipment isn't real common stuff here, and I don't think
I would want to risk getting arrested while trying to get fuel from a piece
of heavy equipment sitting around somewhere. If the equipment is in use,
again, I don't think that the operators would be willing to share
fuel when they are under orders to move debris and open roads.

>
>A diesel can also run on home heating oil, JP4, kerosene, or
>even vegetable oils such as peanut oil, corn oil, or other
>cooking oils. They stink a bit, but they work. The diesel also
>is usually more fuel efficient, so you don't need so much fuel.

>And the diesel is usually more rugged, and usually lasts longer,
>than gasoline engines.
>

I think most of the above gets to be hair splitting. I'm not
sure any generator owner will want to subject his diesel to
cooking oil.

In my opinion, unless the generator is going to be used to
power a building, which may mean it will sit for years before
being called upon, I would stick with gasoline for a radio
club who will(hopefully) use the generator on a regular basis.

If the club does get a gasoline engined generator and long term storage
becomes a problem, there are simple kits which will convert it to
run on propane, although that is difficult to find also.

Having lived through Andrew, I know that in the end, it was
planning that made the difference. Our radio club made sure that we
not only rotated operators, but provided them with anything
else they needed, including generator supplies. We were in the
fringe are of the strom, so we were able to be an effective
aid.

Something else to consider. All the planning in the world isn't
going to amount to a hill of beans if you end up being directly
in the affected area where there is mass devistation. You will be
too busy trying to survive yourself, much less than aid in any
emergency relief. The best equipment in the world won't do you
any good if it is destroyed or made unservicable by the incident.

A plan to accept outside help needs to be devised as well.
I know this may seem off topic, but it all plays a role in
disaster planning. A generator is just one piece of the puzzle.

Regards,

Bruce, WB4YUC

If Michael wrote that yesterday was Saturday, it probably was
when he wrote it.

> Also, didn't the FCC state that requests received before the 23rd would
> be returned to the sender? In that case, if yours was delivered yesterday,
> wouldn't it be returned to you?

No they never said any such thing. The filing date of the
application is the date of arrival it arrives on a non-holiday week
day. Otherwise, the filing date is the next non-holiday week day
following the date of arrival.

Only premature filing, i.e. a filing with a filing date prior to the
start of the applicable Gate, will result in rejection and return of
the application, not premature arival.

My application also arrived on Saturday, and both mine and Michael's
will be treated no better or worse than the Monday arrivals. BTW, I
could only think of 3 calls to put in the space available for 25. I
must lack imagination.

Hi

A few weeks ago, I had read to me (I am Blind) a Letter from the Radio Society of Great Britain informing me that with regret they would no longer be granting Free Membership to Disabled Persons and that I would have to pay P18 in future. However, they would *CONTINUE* to give Free Membership and a Free Copy of the Tape Version of "RADCOM" to Blind Persons. (As my Records at HQ should show me to be Blind, it would have been nice if the Letter had been in an Accessable Format - Tape or DOS Text File - but then you can't have everything can you?)

I was certainly interested in this Free Tape Version of "RADCOM" which was to *CONTINUE*. Some years ago, when the R.S.G.B. introduced Free Membership for the Disabled those of us who are Blind were told that if we wanted to receive Extracts of "RADCOM" on Tape we would have to pay a *MINIMUM* of P10 per year! I have to say that at the time I accepted the 'Offer' without delay as at that time I was paying *FULL* Corporate Membership *PLUS* P7 per year to another Organisation for a Tape Version of "RADCOM". I have paid the P10 per year each January by Standing Order ever since. Do I take it that I am due a Refund of all thos 'Tenners'?

As I consider it most important that the Radio Society of Great Britain should be supported by all those with an Interest in Amateur Radio and Related Hobbies, despite the fact that they don't always 'get it right' all the time, I will probably opt to increase my Standing Order to the P18 but it does seem a little strange that those of us who are Blind should not have been aware of the previous change to wholly Free Membership - if it did change!

73 de Keith G8EAP and G0WQD
(R.S.G.B. Member since January 1964)

[Note to the R.S.G.B. 'Lurker' (see Posting "Not The Last Word"): Feel free to convert this to a 'Letter to the Editor' for "RADCOM"]

Hi all... first-time poster to r.r.a.m...

We're considering taking up a collection to buy a relatively cheap shortwave radio for a friend of ours who is spending the next few months in Bonn, Germany.

We've heard rumours of fairly strict restrictions about the shipment/ownership of these kinds of radios within Germany. Talk of fees, import restrictions, etc. have scared us slightly.

Anyone have any ideas what kinds of hoops there are to send this to our friend? He's not as versed in German as he'd hoped, and I'm sure he'd be interested in knowing what's going on back in Canada.

Thanks for any advice. If you want, you can follow up to this group, or e-mail me personally at chris.neuman@ualberta.ca

Thanks!

Chris Neuman

Don'k know if your bird is old enough to have a mechanical voltage
regulator. I had a problem like that in a '61 Cessna 172B. Would hear
a regular "tick" in the radio audio in flight. Knew it wasn't strobes -
didn't have any and the beacon was the old fashioned "rotating" kind.
Finally figured it out one nice VFR day when I let my gaze fixate
on the engine instrument cluster (Naughty!) long enough to see the
same "tick" in the ammeter pointer as the voltage regulator switched
on and off.

Good luck and 73

Yes, there is a homebrew aspect to this response further down....

And what if, try as you might, you couldn't get the technical aspects of the tests right (many people can't)? Would you cry "discrimination" because, after all, why do you need to know what thosed damned transistor squiggles and Ohm's law thingies are? Only homebrewers need to know these things, not appliance operators. Who needs to know how an engine works to drive a car, after all? Why do you have to understand the components of a phase modulated TX when all you ever intend to do is key the mike on your Yeasu wonderradio?

I could make as big a case for removing most of the technical requirements as you are making for the removal of the code requirement. If successful, would we be better Hams? I don't think so.

Mark my words, if the CW requirement is removed, the technical requirement will follow. That would be a sad day.

And before anyone cries, "but it's alright for you, you have passed the tests", I'll point out that I have been a supporter of the code requirement both before and after writing my tests recently (a quick search using Deja News will verify this).

Again, I like the homebrew aspects, and there is no simpler homebrew starting point than a CW TX. The CW requirement encouraged me to enter, as I know there are many people out there with whom I can communicate using my freshly made homebrew TX. A selfish position, perhaps, but no more selfish than those who clammer to have the requirement removed because they cannot pass.

>How would I get started in HAM radio? I don't have ALOT of money, but I'm
>willing to shell out just about anything less than $100. Also, how would I
>get a HAM licence?

You need a Canadian license, of course. I don't know if there is a website with Canadian info. However, the ARRL has one with beginner info for US hams. It is www.arrl.org. Give it a look. There's lots of good information there for the beginner. Though the licensing details are different for the US and Canada, there are large areas of similarity. I think Industry Canada handles your amateur licensing now. Give the local branch a call for more info. And try to find a local radio club and join it. You'll find a wealth of experience and help there.

Now as to getting on the air for under $100, it can be done, though it may take a bit of effort on your part. If you are interested in VHF or UHF, you can find old or surplus radios for under $100, usually closer to $50, that will serve you very nicely. They may need a bit of work, but nothing you can't handle with a little help and advice, and many of them will outperform brand new radios when you're done. They'll be a bit big by current standards, however.

Things to look for are Motorola Micors or Mitreks, or GE Exec II or Mastr II models. These are trunk mount FM radios originally used by land mobile or police. They were made to last, and they were made to perform well, and most of them still do. You may also find smaller radios. The Motorola Maxar and the GE MVP are under dash mount radios. While they aren't quite as robust as the trunk mount radios, they're still good. All these radios were intended to be mounted in cars, but you can use them at home too with a 12 volt power supply.

A few radios made originally for amateur use which are worth considering (a good number of older amateur rigs *aren't* worth considering) can also be found for under $100. These usually aren't as good as the commercial surplus radios mentioned above, but they're usually smaller and "cuter". A couple of models would be the IC22A or IC22s, and the TR22A. You might also find an old 2m handheld radio for $100. The model to look for if you can find one inside your budget is the IC2AT. For less money, you can probably find an old Wilson MkII or MkIV crystal controlled handheld. And surplus Motorola and GE handhelds can also be retuned to the ham bands. (These, especially Motrolas, still command a premium price among some hans, though, so you're likely to find an amateur HT cheaper.)

Note, I don't recomend a handheld as your first and only radio. It is really a specialized tool for foot mobile operation, and really

doesn't work well for other uses, but foot mobile may be just what you want.

You can also build a simple FM radio for well under $100. There are single chips which handle the receiver and transmitter functions that are only a couple dollars each (Motorola makes some suitable ones normally used in cordless phones (but the chips will work up to 200 MHz), and you may be able to rob them out of an old cordless phone whose only sin is fried batteries and spend zero dollars). This will be very low power, of course, so you will need to spend another $15-$30 to get the power up to a respectable level with a simple amplifier. RF Parts sells suitable hybrid modules for this, or you can build one from a couple of discrete transistors and a handful of other parts.

Note, for crystal controlled radios, and that's most of those I've mentioned, you're also going to have to buy crystals. Those are about $10 each, so consult the locals for the good frequencies before dropping money on crystals. One repeater and one simplex frequency will be enough to start, but choose the right ones for your local area (see your local radio club for advice).

Note too, while I always encourage people to build, and the above project is almost foolproof if you follow the Motorola application notes, a bit of test equipment really is needed. The most important piece of test equipment is a good working receiver. Chicken and egg time, eh? So I suggest you go with a used working radio as your first rig. Later you can build things using it as a test set.

Getting on HF *effectively* for under $100 is a bit more challenging. You may be able to find old old equipment, or very badly broken equipment in that price range. Or you could certainly build a low power transmitter for well under $100, transmitters are easy, but the receiver is a problem. An *effective* HF receiver is going to push your $100 budget all by itself. In fact, most of the cost of a top line new transceiver for HF is in the receiver section, not the transmitter section, and we're talking in the $2000+ range there.

Of course you don't have to get that fancy. You can build your own receiver for under $100 that'll work well enough to get you on the air, but that does require a bit of test equipment to do properly, and the best single piece of test equipment you can own is once again a good commercial receiver. Chicken and egg again. If you can find a local ham to help (and you should try very hard to do this anyway), you might be able to use his test equipment, including his receiver, for tuning up your own homebuilt unit.

But perhaps the better course is to find a bit more money and get an old *working* commercial rig as your starting point on HF. You can find a Drake 2B for around $100 in working condition (though some of the tubes may be a bit weak). That was once one of the best receivers, and it is still good enough to be useful. Or if you can

scrape together $200-$300, you can find *transceivers* (both transmitter and receiver in one box). The Drake TR3 should be in this price range (and maybe a somewhat abused TR4 as well). The Galaxy V MkII is in this price range, and that's a compact 400 watt PEP unit, quite respectable. Tubes are hard to find for it now, though, and that could be a problem. Stepping up to the $300-$400 range, you have several good choices. The TS520 should be in this price range, or an early FT101. TR4Cs in better condition will also be in this range. You might even find one of the early all solid state rigs in this range. That gets you away from hunting now rare tubes, but some of the early all solid state radios were really wretched, and the older tube stuff may work better.

Now none of these will really be up to modern performance levels, but they'll certainly work, and are still better than some of the rigs many of us older hams started out using. The Drake 2B wasn't out yet when I started, and I couldn't afford a surplus R-390 (there weren't many of those on the surplus market back then anyway), so I had to make do with a much used S-28 I found in a fleamarket for $5 (real money back then). That was positively ancient even back then, but it worked well enough to let me hear my signals, and those of a few others.

And hearing the diddle-diddle of RTTY soon had me searching out a decrepit, and rusted solid, old boat anchor teletype machine from the RR junk pile. For me, beeping Morse got old *real* fast. I spent a bunch of hours in my daddy's machine shop fixing up that old TTY, but when I was done it was as ready to eat trees as the day it left the factory. I scrounged a pair of 211 tubes and built the most godawful push-pull power oscillator you ever saw, with straight AC on the plates (from an REA "donated" transformer), and FSKed it with the loop relay.

The government soon took note of my "note", and sent one of those cute pink QSLs in its little window envelope which quickly had me hunting up rectifiers and filter capacitors. My "bible", a very old edition of the Handbook found in the county library, mentioned electrolytic rectifiers and Leyden jars. I raided my grandmother's stock of canning supplies, and soon had a string of electrolytic rectifiers bubbling away happily and feeding a stack of Leyden jars.

I proudly sent the government a description of my "fix" to the rough note problem. When I answered the knock at the door, boy was I surprised to meet those two nice FCC guys. They'd driven all the way from Louisville to see my station. They let me keep it too, but made me put a NO SMOKING sign over the barn door and made me promise to keep the doors open when I transmitted. The next mail I got from them was a package containing a brand new 1963 Handbook. I still have it, sitting in a place of honor on the shelf behind me as I type this.

Remember, any radio at all is better than no radio.

Anyone out there have the specs on an E.F. Johnson air variable
capacitor model 153-11-3. Why don't they put the value on the device
and make life so much simpler. :)

Watch out for those Coleman generators with Honda engines versus the same size
all Honda. I looked at one of the Coleman hybrids (3500w) and the engine was rated
at about 5.5hp where the all Honda had a 6.5hp. I may not have the numbers exact,
there is more to a Honda than most people realize.

Hi there Keith,

I do remember your posting here vaguely.

Despite being disabled, I have to pay the full corporate rate (GBP36). The reason is that the RSGB criteria is disabled for life, with no chance of working again. I have ME, quite badly, and have had this condition since the end of 1993. However, I still don't know if I will work again, and although my doctor was quite happy to certify that I am unlikely to work for the next five years, certifying that I am unfit to work for life is another matter entirely. Despite this, I have been assessed as unfit to work 'until further notice' by the DSS! But RSGB will not accept a 'five year' declaration from my doctor, claiming that if the restrictions on the concessionary membership were relaxed the whole thing would be open to abuse. I don't connect the length of time that I am likely to be disabled for with the likelihood of abuse - either way they could still require a doctor's letter (they won't accept DSS paperwork).

I didn't bother taking this up with Potters Bar, as in the middle of this correspondence, I learnt that the free membership (for disabled people, *not* blind people) had been squashed, and was now GBP18. Considering that a doctor's letter would cost about GBP6.50, it didn't seem worthwhile.

I know that we've had this thread before (in uk.radio.amateur), but thoughts anyone? And if this is going to appear in 'The Last Word', I'd like to know about it.

The PLL-controlled LO in a scanner could cause that effect. Or an
ht running in scanning mode. You may have already eliminated this
in your debugging -- but it's one more idea.

Good luck.

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 23/2330Z SEPTEMBER 1996 BY IPS RADIO AND SPACE SERVICES
FROM THE AUSTRALIAN SPACE FORECAST CENTRE
SUMMARY FOR 23 SEPTEMBER AND FORECAST FOR 24 SEPTEMBER - 26 SEPTEMBER

1A. SOLAR SUMMARY
Activity: Very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 70/5

GOES satellite data for 22 Sep
Daily Proton Fluence >1 MeV: 1.5E+07
Daily Proton Fluence >10 MeV: 1.8E+04
Daily Electron Fluence >2 MeV: 1.1E+09 (very high)
X-ray background: A1.8
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
24 Sep 25 Sep 26 Sep
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 24 Sep: 69/3

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: Active to minor storm

Estimated Indices : A K Observed A Index 22 Sep
Learmonth 20 3335 4422
Fredericksburg 20 22
Planetary 22 22

Observed Kp for 22 Sep: 4353 4422

2B. MAGNETIC FORECAST
Date Ap Conditions
24 Sep 20 Unsettled to active, with the chance of minor
storm periods.
25 Sep 20 Unsettled to active, with the chance of minor
storm periods.
26 Sep 20 Unsettled to active, with the chance of minor
storm periods.
COMMENT: IPS Geomagnetic Warning 10 was issued on 19 September

and is current for interval 23-26 September. A geomagnetic disturbance
alert was issued at 2207 UT on 23 September for K = 5 during
the period 09 - 12 UT, 23 September.

3A. GLOBAL HF PROPAGATION SUMMARY
Latitude Band
Date Low Middle High
23 Sep Fair Normal Fair
PCA Event : None

3B. GLOBAL HF PROPAGATION FORECAST
Latitude Band
Date Low Middle High
24 Sep Fair Normal Fair
25 Sep Normal Normal Normal
26 Sep Normal Normal Normal

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Date T index
23 Sep 2

Observed Australian Regional MUFs:
Darwin: Depressed 10-30% for the period 00-08UT,
otherwise near predicted monthly values.
Townsville: Depressed 10-20% for the period 00-06UT,
otherwise near predicted monthly values.
Sydney: Near predicted monthly values.
Some spread F observed during local night at Hobart.

Predicted Monthly T index for September: 9

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
Date T index MUFs
24 Sep 0 Depressed 10-20% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.
25 Sep 9 near predicted monthly values
26 Sep 9 near predicted monthly values

Well, I can see that I'm dealing with a person of some intellect here.

> >Newer technologies exist, but not in the Ham Radio domain,
>
> of course they don't (in ham radio) ... you folks keep out most of the
> modern thinking, progressive people with your backward thinking.

The disproof of this claim lies in the history of the codeless tech. The requirement has been eliminated there. Now that five years have passed, what new spectrally efficient technologies have been deployed? The answer, of course, is none; most codefree techs use FM.

Yet another proof in the opposite direction. Most of not all of the spectrally efficient technologies were developed by folks who possess a CW enabled ticket.

> >nor are they a cost effective replacement for CW,
>
> that's a rediculous assertion ... that's like saying cars can't compete
> with horses ... cars can cost lots more than a horse, but they still
> work better for getting across town or the state ...

That's a rather perjorative and irrelevant comparison. I can buy a used SSB/CW 100w rig for about $300; add about $50 for a really nice keyer and paddle. Now, show me where I can buy anything useful on the ham bands that's more spectrally efficient for less than that. And that allows me to converse with hundreds of thousands of thousands of people around the world.

> >which nearly 90+ years after its introduction, is still the most spectrally
> >efficient
>
> IT IS NOT SPECTRALLY EFFICIENT!!!!!!!!!!!! In terms of bits/sec/Hz, it's
> piss-poor ... CW would not come close to meeting the new spectral
> efficiency requirements being imposed for future type-acceptance of
> equipment in the land mobile radio bands ... NOT EVEN CLOSE!!!

It's more spectrally efficient than either 300 baud AFSK packet, AFSK RTTY, or SSB, which are the only commercially viable alternate technologies. That's the only empirically relevant comparison. Yes, I'm well aware of the various technologies that exist in theory, and I'm also well versed in what it takes to make that theory a reality. But the simple truth of the matter is that the

moment the CW requirement is negated, the HF bands will fill up, not with CDMA or coherent modulation, but with SSB.

> Just because you'd LIKE TO BELIEVE some mythology, doesn't make it true.

Humor me. I've been at this a long, long time.

> Why? Why would the world end? Are you afraid that you might turn your
> radio on some day and find that some "damned no-coder" was using "your"
> frequency???? (that seems to be the principal objection of the
> pro-coder)

No, and in fact, I was (and still am) a proponent of the codeless tech, as a way to introduce new blood to hamdom. But the VHF+ bands don't face the same level of scarcity that the HF allocations do; the small slivers, lack of reuse, and international nature of HF make it a different beast entirely.

My objections have nothing to do with fraternalism, but are instead grounded in the practical and technical aspects of the communications system known as amateur radio.

>ferrites slipped over the coax at the feedpoint will do too).

Considering that the feedpoint resistance of a dipole can vary from 0
to 100 ohms depending upon its height (in wavelengths) above (perfectly
conducting) ground, I'd suggest using a balanced tuner and open-wire
feedline.

Over a "real earth" ground the variation is somewhat less (45 to 100
ohms), but you might as well still use a tuner; it will only take
a couple hours to build one that will perform as good if not better
than a commercial job.

: I've offered /'keI bEk/, /'kE bEk/, even /'k@ bEk/. This of course is
: with a midwesterny-Californian American English "accent".

: For those unfamiliar with the version of the IPA we use here on a.u.e,
: here's a translation:

: [eI] is the "ei" in "eight".
: [E] is the "e" in "end".
: [@] is the schwa, the "u" in "but".

: To this, there is the "w" pronunciation, /'kw@ bEk/ or /'kweI bek/,
: and (probably) the one everyone will stigmatize, /'kwi bek/ ([i] is
: "long e", as in "queen"), wherever the stress is put.
....
: For myself, /'kE bEk/ seems closest to what I do, roughly "keh-beck",
: with the first vowel being that in "Ken", "keg", or "kept".

In the 4 out of 4 US dictionaries I've looked at, the "w" pronunciation
(in one variant or another) is listed as the standard English pronunciation,
and some variant of /keI bEk/ is listed as the French.

My question is, where does /'kE bEk/ come from? It's not the French
pronounciation, because there's an accent aigu over the first "e":

In ISO-8859 characters: Quï¿½bec
ASCII convention: Que'bec

Thus the first "e" sound is a French phoneme that doesn't exist in
English at all. It's the French version of "ay", as in "day", but
it is short and pure, so it's NOT /eI/, the English diphthong version
at all. But certainly, if you're trying to mimic the French
pronunciation with English phonemes, /keI bEk/ is MUCH better than
/kE bEk/. So: where did THAT pronunciation come from?

> efficient than CW in bits/sec/Hz ...

PACTOR is no more spectrally efficient than its modulation technique, which of course is AFSK RTTY. CLOVER does quite a bit better, but occupies more bandwidth, is expensive, proprietary, and therefore not widespread. It's quite a stretch to assume that hams without a CW background would automatically invest in CLOVER hardware, instead of just using SSB.

> So then we'll finally HAVE to start to use something more efficient,
> won't we?

In making this argument, you've justified the fraternalists belief in coercion. The empirical counter argument can be found in urban RF environments; the FM bands are completely locked up in repeaters, and so, rather than developing some spectrally efficient hardware, FM folks are bleeding into the weak signal segments.

So, Carl, we've had five years of codefree licensing in the VHF bands. Where is the new hardware? Where are those technical people who in theory are being kept from doing neat stuff? Unless you can demonstrate success in this area, you can't claim that anything will be different on HF.

> >Humor me. I've been at this a long, long time.
> So have I ...

Actually, no, you havn't been, but that's also irrelevant.

> From what you said, it appears that it's grounded in "if we let more
> people in, the bands will be too crowded (and you don't want to "share
> the wealth") ...

It's not a question of sharing the wealth. It's a question of functionality. It's the reason why you don't pack tons of people into elevators, or put a waterbed in an old house -- the system breaks and is useful by no one. The utility of amateur radio as a backup national emergency communcations system is far, far more important (from a legislative standpoint) than doing the newest, neatest thing. That's not to say that technology development isn't important, but it is secondary as far as Congress is concerned.

3668. UK morse test - info wanted

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-24 00:00:00 UTC
From: Simon Twigger <simont@post.its.mcw.edu>
Message-ID: <324855F9.7AFC@post.its.mcw.edu>
Source record: 216160

Hi There,

Ideally I would have posted this to the UK amateur radio newsgroup but our news server refuses to access it. :)

I am trying to get some information on the UK morse test as I would like to find out if there is any time I can take it when I am back home over Christmas/New Year. I have a class B licence and would like to upgrade it. I checked the RSGB WWW page - very nice it is too - but there was no email contact address given and Im trying to avoid the phone bill from the US if I can! I found the details on the nature of the test but I couldn't find any on when and where the tests might be:

Im trying to find information on any test sessions that might be taking place in mid/late december (probably not too many, I suspect) somewhere in the midlands, though I can always drive elsewhere.

I would also like to know if it is possible to take the UK morse test here in the US, and if so, where I would have to go to take it.

If anyone knows if the RSGB does have an email address where I can contact them, then that would be most appreciated. Otherwise I suspect I will have to bite the bullet and call them up on the phone. :(

Thanks for any information anyone can give me,

Simon. AA9PW/G1SNT

>
>Jeff KH2PZ / KH6

Well, lets see. The propagation time is roughly 3000/186000 or
About 16 milliseconds. That's how long it'll take for the message
to start reaching the destination. The time it'll take to arrive
completely depends on the length of the message.

So how long is the message? If it is 120 words (PARIS standard),
then on a good channel it'll take about a minute. On a heavily
contending channel, it would take longer, all the way up to link
failure due to congestive collapse, since you're basically operating
pure ALOHA on HF. But if we assume we're at maximum ALOHA capacity
on the channel, IE roughly 20% that of a non-contending channel,
it'll take about 5 minutes. We can stay near the ALOHA limit by
proper use of the p-persist and slottime parameters (if everybody
on channel plays nice).

Note, the propagation gods have to be smiling, of course. If there is no direct path open between the two coasts, the packet station may have to depend on an alternative routing via a series of relays over which there is a path. This can add from a few minutes to a few hours to the message delivery time. There's a station in Panama operating 7x24 which is often used for relay when there's no East-West path, because the North-South path is usually still open to either coast from Panama.

But Morse can do no better. Even when the NTS was fully staffed by Morse operators meeting a full schedule of traffic nets, several hours were often required to relay a message from coast to coast.

If you'll accept a different digital mode than packet, say PACTOR II, then your 120 words are delivered in about 6.4 seconds on a good channel (Clover performance is about the same), and in about 8 minutes on a channel so bad you'll give up with OOK Morse. Fast enough for you?

Now, how long will it take you to pass that same 120 word message, error free, beeping it out in Morse? On a very good channel? On a channel so bad you can't reliably pick the carrier out of the noise by ear? When there's no path at all and you have to find a relay station?

Keep in mind that for virtually any channel where OOK Morse is usable at 20 WPM, AMTOR is usable at 60 WPM, PACTOR is usable at approximately 100 WPM, and Clover and PACTOR II are usable at approximately 470 WPM (or better). On really bad channels, where OOK Morse speeds drop to 1 or 2 WPM net with *very* good operators, AMTOR and PACTOR pretty much fall apart completely, Clover starts to stumble, but PACTOR II is still hammering along at about 15 WPM net, error free.

And theory says we can beat PACTOR II performance by about 4x if we use a proper coherent I/Q receiver instead of just a digital back end to an analog superhet receiver as we do it today, IE we can get back to 60 WPM on a channel that only supports 15 WPM PACTOR II now, or 1 to 2 WPM Morse now. Or conversely, we can work at signal levels 4x less than today while maintaining the same throughput (that puts manual OOK Morse completely out of the running). And as I noted in another message, such a receiver is rapidly becoming within amateur reach.

The LOWFERs have a coherent digital system, detailed in Vol 1 Issue 1 of Communications Quarterly, which can reliably work 1,000 miles *groundwave* (day or night) on the 1750m band with an ERP of under 10 *milliwatts*. That's the current "amateur" state of the art in digital weak signal performance.

The VLF path loss is as severe as EME operators have to contend with (though the fading characteristics are different), and EMEers need well over 1 kW ERP to make contacts using OOK Morse. That's some 40 db more signal required for manual Morse versus a machine digital

method built by "amateurs" who aren't necessarily even licensed hams.
And their system doesn't even use a modern DSP processor or any FEC.
That's *raw* performance from their RF modems. We can do better.

Gary

>exposure for a 100W transmitter with 3 dB loss in the feed line?

That's a good beginner question, Bill, but you did leave out one
important bit of information, the frequency for which the calculation
should be done. For aspiring amateurs who want to give it a try, lets
say the frequency is 7.069 MHz.

As an intermediate level question, we could ask why that calculation
doesn't assure us we're within safe limits.

As an advanced question, we could ask for a plot of the predicted safety
perimeter of a specified antenna installation (still somewhat idealized,
but closer to real world by having other objects in the near field).

And for the superduper class, we could ask why *that* isn't good
enough either, and have them explain how to really find out what
the safety perimeter's boundaries are.

They shouldn't be allowed to operate until they can answer that
last question.

3673. service disconnect (was 4-5 kw Generator Reco)

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-24 00:00:00 UTC
From: alan@curta.cc.columbia.edu
Message-ID: <529gt5$4bl@apakabar.cc.columbia.edu>
Source record: 216165

See the National Electrical Code Handbook. Published by the NFPA (National Fire Protection Association). Should be on your ham shack shelf right next to your ARRL Handbook. There are sections on code requirements for bonding ground electrodes (like the kind you use for your station ground), amateur radio antenna systems (yes, a specific chapter for us:-), and generator disconnects.

Basically, to be legal (according to the NEC; your local codes may differ), the disconnect mechanism has to be idiot-proof in protecting the utility from your generator output. This means, back-feeding via a power outlet or by a spare breaker like I got to do in Wilmington, NC recently (son of a Fran survivor:-) is technically not a good thing. I did put a padlock on the main breaker in the OFF position to make it impossible to connect the house to the utility mains.

At my home, I've installed a GenTran, Inc. transfer switch which I found at a local Home Depot although I understand from others that it is not universally available at other stores. It's somewhat overkill but is truly idiot-proof.

The West Palm Beach-based Florida Power and Light crew, before turning the power back on, personally visited each and every house to confirm that generators were isolated from the main. They cut and taped the wires from the generator on my mom's neighbor's house 'cuz it was not properly isolated.

Generator here is a Generac/Nagano 4000XL from Home Depot. Very noisy, but so were the other half-dozen generators in the immediate vicinity. For emergency use, generator noise is not such an issue as for routine use (at construction sites, etc.). It ran OK for 4 days straight (I waited for the water to subside in Virginia before driving south with generator in trunk:-).

The most amazing thing was that among all the downed trees and powerlines, this ham's tower up the street from my mom's house was instact. I guess it wasn't high enough.

> the underlying physical layer problem.

Yes. ARQ is indeed a stopgap.

ARQ is good at taking a low error rate and making it essentially zero.
But it's terrible at high error rates. A much better approach is to
add forward error correction at the physical layer that reduces the
error rate to where ARQ can operate efficiently.

Depending on the FEC code chosen, during normal operation there may
be some residual errors. Or the decoder may produce either perfect
data or nothing at all if the channel is blocked or broken.

An example of the former is a Viterbi-decoded
convolutional code by itself, and examples of the latter are
sequentially decoded convolutional codes with long
constraint lengths, and concatenated Reed-Solomon/Viterbi
combinations. Depending on the channel characteristics you may or
may still want an ARQ protocol at the link layer to
mop up the residual errors, but this is decidedly optional; as long
as the error rate is low enough for TCP to perform well, there's
no need to make it zero.

As an aside, a concatenated RS/Viterbi decoder is used in DSS
(DirecTV/USSB). That's why the system usually works perfectly or
not at all. If you slowly move your hand in front of the feed,
the picture tends to remain perfect until it suddenly freezes. That's
because the BER curve of the concatenated code is extremely steep.
This is characteristic of all strong codes.

Phil

Hi Steve, when you say "long wire", do you mean end-fed? Do you want to
work all HF bands? 160m? What kind of radiation pattern do you want?
For 10m-80m, it's hard to beat a 102' center-fed with ladder-line.

NEWSLINE TO CELEBRATE NEWSCAST 1000

On Friday October 11, 1996, the Amateur Radio Newsline (formerly The Westlink Radio Network) will release its 1000th consecutive week of informational programming to the worldwide Amateur Radio community. By way of celebration, shortly thereafter Newsline will also make available a thirty (30) minute special audio presentation titled "Newsline 1000" telling the story of the Newsline service itself.

This special program will be hosted by Tony Valdez KC6LXQ (KTTV) with in-studio guests that include Westlink Radio Network / Newsline co-founder/producer Bill Pasternak, WA6ITF (KTTV). Joining Tony and Bill will be former Production Coordinator Bill Orenstein KH6QX (NBC Network - Retired) along with anchor/reporters Andy Jarema N6TCQ (AJ Productions), Robert Sudock, WB6FDF(KTTV) and Mert Garlick, N6AWE (KTTV).

Taped segments will include such well known Newsline personalities as Alan Kaul, W6RCL (NBC Network News), Jim Davis, KU8R (WZVU), Roy Neal, K6DUE (NBC Network News - Retired), South-East Bureau Chief David Black KB4KCH (First Frame Video) and the other half of the Westlink Radio/Newsline founding "team" Jim Hendershot, WA6VQP (Radiodesign Labs). Also a special salute to the hams and non-hams who volunteer their time to putting Newsline on the Internet including Dale Cary, WD0AKO and "Big Steve" Coletti.

Newsline came into being in 1977 as The Westlink Radio Network. It was started as a simplex (direct frequency) bulletin service

to local users of the 222 MHz band in Southern California. Its purpose was to educate hams on the then pending and (somewhat controversial) repeater deregulation legislation winding its way through the FCC.

The first newscast was recorded at the home/studio of Wayne Rankin WA6MPG. Rankin, a broadcast engineer with CBS then played the newscast while motorcycle mobile station parked atop a 3800 foot mountain to a small audience of Los Angeles ham radio operators listening on 223.500Mhz. The date was September 7, 1977 and the service has provided a weekly ham radio newscast summary - without interruption - every week since then!
Today, some nineteen and a half years later, this news service, now known as "Newsline," utilizes time at modern state of the art production facilities donated members of the broadcast community across the nation. Distribution is accomplished using ten automated telephone newsfeed lines nationwide and three audio "websites" on the Word Wide Web. A text version of Newsline is also available from numerous locations on the Internet and World Wide Web. All of this is accomplished by unpaid volunteers in the United States and around the world. (See attached listing.)

The weekly Newsline bulletin is produced the Westlink Radio Network Inc., a Pennsylvania chartered not-for-profit adjunct of the Philadelphia based Holmsburg Radio Club. Production operations are supported in part by donations from listeners and by members of the all volunteer Newsline staff themselves.

In addition to the weekly newscast, Newsline, with corporate underwriting from Yaesu USA Corporation and CQ Magazine also sponsors the annual " Young Ham of the Year Award." This award is presented to a United States licensed radio amateur age 18 or younger who has utilized Amateur Radio in some way to benefit mankind. Presentation is made each August at the Huntsville Hamfest Awards Banquet in Huntsville Alabama.

Copies of the program "Newsline 1000" will be mailed to members of the media prior to its air date.

In addition, a two-part story on the establishment of Newsline will appear in the October and November 1996 issues of Worldradio Magazine. Written by founder / producer Bill Pasternak WA6ITF, the article traces Newsline from its inception right to the present day. Also included is a complete listing of current news-feed telephone lines, audio sites on the World Wide Web and Internet locations from where Newsline scripts and other materials can be downloaded.

I read the application differently. I interpretted the instructions as
follows:

1) You must date the application the same day as you sign it. I signed
it on Sept. 20, the same day I took it to FedEx. The instructions
are very clear on this issue.

2) You cannot post-date your check. This might mean that if you put it
into a courier service on Sept. 20, the check could be dated
Sept. 23 (the first business day after the application arrives). But
in no case can it be dated after the date the application arrives.
I didn't take the chance and dated it Sept. 20 also.

3) The critical date is the arrival date, not the date on the application
(which is the date you signed it). Again, the instructions are clear
as to the fact that the arrival date can be on or after Sept. 23, but
not a BUSINESS day before then. If the application arrives on Sept. 21
or 22nd (Sat or Sun) then the "official" arrival date is Sept. 23 as
that is the first business day after the weekend arrival. I FedEx'd
mine on Sept. 20 for arrival on Saturday, Sept. 21. I also interpretted
the rules to be that if the application arrives on Sept. 20 or before,
that it could (but not necessarily would) be returned to you.

Thanks,

Jim Johnson WA6SII

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 24/2330Z SEPTEMBER 1996 BY IPS RADIO AND SPACE SERVICES
FROM THE AUSTRALIAN SPACE FORECAST CENTRE
SUMMARY FOR 24 SEPTEMBER AND FORECAST FOR 25 SEPTEMBER - 27 SEPTEMBER

1A. SOLAR SUMMARY
Activity: Very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 70/5

GOES satellite data for 23 Sep
Daily Proton Fluence >1 MeV: 1.2E+07
Daily Proton Fluence >10 MeV: 1.9E+04
Daily Electron Fluence >2 MeV: 1.2E+09 (very high)
X-ray background: A2.4
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
25 Sep 26 Sep 27 Sep
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 25 Sep: 70/5

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: Unsettled

Estimated Indices : A K Observed A Index 23 Sep
Learmonth 8 2222 3222
Fredericksburg 10 22
Planetary 10 25

Observed Kp for 23 Sep: 3545 4423

2B. MAGNETIC FORECAST
Date Ap Conditions
25 Sep 20 Unsettled to active, with the chance of minor
storm periods.
26 Sep 20 Unsettled to active, with the chance of minor
storm periods.
27 Sep 15 Unsettled
COMMENT: IPS Geomagnetic Warning 10 was issued on 19 September
and is current for interval 23-26 September.

3A. GLOBAL HF PROPAGATION SUMMARY
Latitude Band
Date Low Middle High
24 Sep Fair Normal Normal-fair
PCA Event : None

3B. GLOBAL HF PROPAGATION FORECAST
Latitude Band
Date Low Middle High
25 Sep Fair Normal Normal-fair
26 Sep Fair-poor Normal-fair Fair
27 Sep Fair-poor Normal-fair Fair

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Date T index
24 Sep -3

Observed Australian Regional MUFs:
Darwin: Depressed up to 30% for the period 04-12UT,
otherwise near predicted monthly values.
Townsville and Sydney: Near predicted monthly values.
Hobart: Depressed 15% for the period 00-08UT, with some spread F
and sporadic E observed during local night, otherwise near
predicted monthly values.

Predicted Monthly T index for September: 9

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
Date T index MUFs
25 Sep -5 Depressed 10-20% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.
26 Sep -5 Depressed 10-30% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.
27 Sep -5 Depressed 10-30% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.

Yeah, that's why they developed it, they needed a way for the students
and faculty on the other islands to use the computer on Oahu. (I think
Gary's wrong here, and ARPA had nothing to do with it -- UofH built it
because they *needed* it.)

> Not interested at all. What interests me are HF modes in which real-
> time two-way communications can take place.

Anybody know what frequencies the original AlohaNet used? I had
a copy of the paper, but I don't seem to be able to find it.
[Abramson, N. The Aloha system. AFIPS Conf. Proc., Vol. 37, 1970
FJCC, AFIPS Press, Montvale, NJ, pp. 281-285.]
AlohaNet certainly did real-time two-way communications, and I wonder
if they used HF? I don't believe all the Hawaiian islands are
line of sight from each other.

I will be trying out a trifuel generator soon. The unit comes with a
gasoline tank and a regulator for Natural Gas or Propane. Since I use
propane for the house, I have a large supply. It doesn't get old/stale.

Then for portable use I can use the Camping trailer's propane or gasoline.
I also think that gasoline engines are easier to trouble shoot and repair,
but again that is personnal taste. Diesel is much safer!

The unit is a 6kw, 120/240 v 1ph from WinCo in Minn.

Hello. I have an Icom BC-35 AC, 120 volt quick charger that I would like to trade for a 2-meter HT amp. needs to be ran on 4 amps or less(something like the Power Plus HL-35V), as I only have a 4-amp power supply. one with a pre-amp would be nice, too. e-mail me with details.

NOTE: the positive contact likes to stick down. I think this is just because of a bad spring, and is easily put back up by opening the case and pressing up on the bottom of the contact. in english, don't slap the pack down too hard, hi hi. this should be an easy thing to fix.

For more details, e-mail me at Spamsonite@hotmail.com

Sam Bradshaw,

3692. Why are most Morse Code sending keyboards and programs incorrect?

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-24 00:00:00 UTC
From: rdkeys@unity.ncsu.edu
Message-ID: <529c6r$v3f@taco.cc.ncsu.edu>
Source record: 216184

I am curious as to why most (almost all) Morse Code sending programs and keyboards (non-computer-driven machines) send the incorrect Morse Code old form and not the current full ITU character set?

The incorrect ones have the opening and closing parenthesis the same. The dollar sign and things like the colon, semi-colon, double-quote, and other characters are often missing.

Perhaps it is only that everyone copied everyone else, or somesuch, especially when it came to eproms in the keyboards? All software programs have no excuse for not getting it right.

Although most operators rarely use such uncommon characters, they should be able to send them correctly, if desired.

So, all software morse code program writers and hardware manufacturers take heed, and fix the thing correctly!

Thus endeth my pet peeve for the day, to all software/hardware CW sending device computerese folks.

Bob Keys/NA4G
rdkeys@csemail.cropsci.ncsu.edu

p.s. I am a dedicated CW man, so send the code/no-code flak to /dev/null.

p.s. Also, if I can get my 2 mhz Kaypro II to do it correctly in basic, with a relatively trivial 100 line program and a 2 part interface, there is absolutely no excuse for the wrong code set and missing characters, etc.

> in bits/sec/Hz)

The pressures on the HF spectrum are entirely different from those at VHF+.
For the most part, industry has abandoned HF in recent years in favor of
satellite transmission, which is more reliable and offers more bandwidth.
Moreover, the HF allocations are international, and as such less subject to
industrial pressure. For these reasons, the amateur HF allocations have
expanded in recent years, while VHF+ has contracted for the most part.

> SSB is actually *more efficient* than CW ... in terms of information
> conveyed per Hz consumed. The fact that its bandwidth is wider than
> even fast CW is irrelevant to the issue of efficiency. To argue to the
> contrary only shows a lack of understanding of the issues involved.

This is right on one account and wrong on two. For starters, the relevant
metric is spectrum*space per conversation, not per bit rate. CW conversations
are simply slower and more compressed. But they take up less than 1/24th of
the occupied bandwidth of SSB. In addition, CW QSOs generally run at
appropriately lower power levels, so the overall occupancy is much lower.

I'd suggest that you read my paper in the 7th ARRL CNC.

Message-ID: <5279rn$3mp@news.ais.net>
Source record: 216221

In <524gq8$8eu@news.Hawaii.Edu>, jherman@Hawaii.Edu (Jeffrey Herman) writes:
>
>What might be true on the drawing board doesn't always occure in practice.

The modernization of ham radio is held back, as is the modernization of computer operating systems, by the insistence by some on the maintenance of compatibility with "legacy" code ...

Why do you think WinDoze sucks swamp water so badly???

CW is more backward compared to modern communications techniques that is CP/M to OS/2 Warp 4.0 (a.k.a. Merlin), which has speaker-independent voice recognition/navigation/data entry capabilities ...

>So far, CW still ranks highest when *all* possible variables such as
>simplicity of equipment, inexpense, number of users worldwide, performance
>versus power, real-time passage of data, bandwidth needed (~500Hz), are
>considered.

The simplicity argument is moot in today's world of VLSI circuitry ... it buys one virtually NOTHING in terms of reliability, size, power consumption, etc.

Cost is also essentially a non-issue ... modern digital circuitry is CHEAP ... 50 MIPS DSPs are about $5.00 in quantity ... 100 MIPS about $11-12 ...

>Also, being able to decode xmissions mentally rather than having
>to rely on complex equipment is one of the greatest factors to consider.

The equipment complexity is, as stated above, irrelevant ... the reliability is MUCH better than a "wetware modem."

>It's true that CW doesn't lend itself well to passage of large files that
>few will ever take the time to read, but that type of data can best be sent
>in a much quicker fashion via internet.
>

Digital systems are NOT, as you imply, limited in their utility to the transfer of large files ... short messages can be passed with considerably more efficiency, robustness, and operator convenience, as well ...

Jeff, NONE of your "arguments" holds any water ... they're just a rehash of several of the more popular "Morse Myths" ... nothing more, nothing less ...

Carl, I was all wrong. You do have a sense of humor. Very good !!!
You can't spell for shit, but then again, YOU can copy 20 wpm in
your head and live in a VHF+ ghetto. So I guess that makes everything
OK.

BTW, those who have been reading your proud statement of TECH PLUS 20+
years all agree, you have no drive and are a status quo seeker. Please
continue with your postings, they provide so much enjoyment, not to
mention they are good for laughs.

Your name really isn't Burt by any chance, is it??

Yaesu FT40, 99 Channel radio. Includes tx/rx mod, tx and receives from 430 -484.This unit is LITERALLY the size of a pack of smokes, maybe a TINY bit deeper, but the same height and width. (Just add an antenna.) Does 99 channels PL _AND_ DPL, Keypad programmable, dual VFO, digital voice (record up to 20 seconds from the radio or by mike and either play back through speaker OR back on the air! Record you call and never say it again! Searches PL & DPL (yep, don't know the PL? Just hit a key, and it tells you! (I Can't find this in the manual, I think it;s a hidden trick.) Comes with low power battery pack, charger, manual, and box. Barely used. Would prefer Bay Area (California) but will ship. $300/BO. Must sell ASAP, make an offer. Either reply via e-mail, or call 415-939-1037 anytime. Thanks

Here in Ct we've tried VC on link circuits where there are no 'users' to speak of and the RF path was marginal. It helped, once in a while as long as there was no serious volume of traffic. As soon as the traffic volume came up, the link just beat itself to death. There is no substitute for having a physical layer that works.

Hmm..... Many fine people have been excluded from an amateur license (below 30 Mhz) merely because they don't know CW, since tests with this criteria _are_ in place.

Sound like just another shade of the same color to me.

BTW: Advanced mathematics does not require a high-school class any more than one needs a class for CW. I'm proof of that.

Steve,

Thanks so much for not disappointing me. Your juvenile outburst was more than I than I could have expected. It is really too bad callsign servers are not available under the bridge. If they were perhaps you wouldn't look quite so stupid. Your assignment when you get your foot out of your mouth is to isto figure out why you look so dumb.

I guess Gary Coffman is right CW does do brain damage. Stop the madness end fast CW testing.

Jerry

3721. 2m Wide Open in Florida

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-24 00:00:00 UTC

Message-ID: <528reo$u84@usenetw1.news.prodigy.com>
Source record: 216244

As we enjoy our first cold front of the season down here, 2m is wide open with tropo ducting.

Last night, I was working repeaters 150-200 miles away with my 5-watt HT and a homemade dipole (made out of a pair of TV "rabbit ears"), about 15 feet in the air.

As of 10:45AM EDT, the band is STILL up. This one may last for a couple of days!

>>One of the reasons I like diesels is that the fuel can be stored
>>for long periods. You can't do that with gasoline. So when that
>>really bad emergency hits you don't have to go looking for fresh
>>fuel right away.
>
>I think we need to define that "long" period of time.
>I have sucessfully stored gasoline for a year. Besides,I would
>certainly hope the owner wouldn't just let the generator sit
>idle.

Diesel will store indefinitely provided you keep it from becoming
contaminated by water, and provided you use a biocide in warm
climates where nasty bacteria like to grow in it. Of course you
can, and should, leave a diesel fully fueled. You'll wreck the
injector pump and the injectors if you run them dry.

Gasoline, even with stablilizer added, loses enough of its volatile
fraction in warm climates to make it unsuitable for use after as little
as six months, IE the octane number changes substantially. Without
stabilizer, it will gum and varnish the fuel system of your engine
too. You can't leave a gasoline engine fueled for long periods. But
if you leave it dry, the seals and gaskets in the fuel system will
dry out and may crack.

>Generators need to be tested routinely, an emergency isn't
>the time to figure out if it is going to fire up or not.

Sure, but you aren't going to run the entire fuel store through
it when testing. A trailer mounted diesel will likely have a
300 gallon tank. A home unit may have a 1500 gallon underground
tank. If you run it an hour a month, which is a good policy
to get the lubricants well warmed and circulated, you're still
only going to burn 3 or 4 gallons a month. That's not nearly
enough to rotate your fuel stock.

>I don't think the storage issue is really a problem here,
>unless the unit were going to sit for more than a year. If so,
>other things need to be done to the engine anyway
>to prepare it for storage, which includes draining out any
>fuel.

As noted above, you don't want to do that with a diesel, and
while you *have* to do that with a gasoline engine, it can
still cause problems with the seals and gaskets.

>Anyone properly prepared will have fresh fuel available,
>this should be included in their disaster planning. Being
>ready for something isn't seasonal.

The nice thing about diesel is that it is always fresh, even
if you've had it stored for several years. You can stock up
when prices are low, as they are seasonally, and avoid any
panic buying situations.

>>Diesel can be gotten from any long haul truck,
>
>I can't see these guys giving up any of their fuel when they are
>expected to haul much needed items into a disaster area, get out
>and deliver more ASAP.

Plenty of trucks get stranded in disaster situations where electric
power may be needed, such as last year's midwest blizzard. In flood
situations too, the big trucks may be stranded, or the roads may be
badly damaged or blocked by debris in an earthquake, etc. It is not
at all unusual to have idled trucks available from which fuel can
be obtained.

>>or from farm equipment, or heavy equipment.
>
>Farm equipment isn't real common stuff here, and I don't think
>I would want to risk getting arrested while trying to get fuel from a piece
>of heavy equipment sitting around somewhere. If the equipment is in use,
>again, I don't think that the operators would be willing to share
>fuel when they are under orders to move debris and open roads.

I guess it is obvious that you aren't from farm country (or at least
think you aren't, you might be surprised at the number of farms tucked
away in areas you don't normally travel). You never mess with a farmer's
equipment without permission, unless you want to be shot. But farmers
keep large storage tanks of diesel on the farm, and have portable, IE
300 gallon, tanks on their field service trucks to fuel their tractors
in the field. In an emergency, it would be unusual for a farmer not to
offer you some fuel, or at least sell you some. And while some farm
machinery is suited to removing debris, I doubt the big combines, cotton
pickers, or hay harvesters would find any use. And their 250 gallon tanks
are almost certainly filled with diesel.

Heavy equipment operators also have considerable on site fuel
storage in most cases. They don't depend on an oil company truck
delivering fresh fuel every day. Like farmers, they prefer to
stock up when prices are low. And the big ditchers, and some of
the specialized cranes may not be needed for cleaning up after
the disaster, and their tanks will almost certainly be full.
Again, you *ask permission* before helping yourself to fuel.
Stealing fuel can get you shot, and that includes stealing
gas from someone's car.

>>A diesel can also run on home heating oil, JP4, kerosene, or
>>even vegetable oils such as peanut oil, corn oil, or other
>>cooking oils. They stink a bit, but they work. The diesel also
>>is usually more fuel efficient, so you don't need so much fuel.
>>And the diesel is usually more rugged, and usually lasts longer,
>>than gasoline engines.
>
>I think most of the above gets to be hair splitting. I'm not
>sure any generator owner will want to subject his diesel to
>cooking oil.

Sure, works fine, just stinks (note, any fast food joint will
have dozens of 5 gallon cans of cooking oil on hand, and without
power they'll have no use for it). More likely though is home
heating oil. It *is* diesel to all intents and purposes. It just
doesn't have the road tax added to it. JP4 and kerosene will substitute
well enough for diesel as makes no difference (they're essentially
#1 diesel while ordinary engine fuel is #2 diesel). #1 is just a
bit more refined and has more of the lighter fractions. In cold
climates, #1 and #2 are blended in winter because #2 by itself
will gel below 24 F. (In a cold weather emergency, if all you
have is #2, you can cut it 10:1 with gasoline to make it flow,
or cut it 2:1 with kerosene. Or you can light a small fire under
the fuel tank to warm it. It's harder than you might think to get
diesel to burn outside the engine, which is another reason its a
good fuel to store.)

<snipped it all....>

Gary,

It is obvious that you are a fanatic when it comes to diesel and
you will try to drive home that nothing else will do. I am
not going to get into that debate, it could be endless.

I'm of the opinion that it depends on the individual circumstances.
All systems have their good and bad points.

These things will need to be weighed by the group buying the
generator. They will need to make the best decision based on how
they plan to use it. That includes whether or not it should be a
portable or towed; air cooled or water cooled; desiel, gasoline,
or even propane. (Crud, for that matter, it could be a wood/coal
burning steam powered generator.)

I just know from my experiences living here in South Florida,
I would rather have a gasoline powered generator, mainly
because gasoline is far more available and I know how to
maintain the gasoline engine.

If obtaining desiel is not a problem in their area and they have
someone who understands how to properly maintain a desiel engine,
go for it. Any system will work, and work well, if properly cared for.

73,

Bruce, WB4YUC

Goes along with my theory about traffic lights after midnight. I apply the "If a tree falls in the woods and there's nobody there to hear it fall, does it make a sound?" principle. By that I mean, if it's after midnight and there's nobody else around (most importantly there's not a cop nearby), and you run the light, does anyone see you run the light?

If you format it right - you can use one of those huge paper cutters. I
usually split an 8.5x11 sheet into three 8.5x3.7 or three 3x5 cards and trash
the rest. It also helps if you have access to a copier like I do.

Hello Gene: (Yevgeni?)

I don't think they have even started to look at the pile. Your friend probably applied under Gate 1 or 1A. According to what I heard/read, the FCC says don't expect to see any calls issued under Gate 2 for 2-3 weeks.

From what I was told anything that arrived earlier than Saturday would be returned.

Good luck!

Well, consider this. A 2m FM HT in Canada costs c.$400. An actual
TNC costs about the same(at only 1200 baud!). That's $800, plus you need
a computer. I'm sorry, but anybody with a computer and $800 in their
pocket is much more likely to spend $200 on a 33.6kbps modem, get on the
Internet, and keep the extra $600.

As for satellite or SSB work, an all-mode VHF/UHF rig costs more than a new
computer. I think the point I'm making there is painfully obvious.

Rig manufacturers need to cut their prices in half, and then do it
again. The reason there's so many codeless hams that are inactive is
because the equipment is so damned expensive. Even spending $400 to talk
voice to the local guys is almost a waste of money, since(apart from
local voice being booooring) they all meet every day to talk to each
other face to face at a local donut shop...

I rather think that some of his ideas are cutting edge. Education opportunities have produced the change in behavior that we in normal society desire. Shock therapy as he applies seems to work. Unlike most in law enforcement, he seems to want long term solutions not more power.

He also desires to work with volunteers rather than totally depend on professionals. We are finding that pros get burned out faster and volunteers bring varied talents as well as heart to the job. Just like reservist are the bulk of the soldiers in Europe, volunteers we be performing increasing portions of public service.

>time two-way communications can take place.

If I read you correctly, you're not interested in making informed
comments about packet radio. Therefore, it probably is a waste of
time to even try to have a discussion with you. However, packet is
a perfectly viable mode for real-time two-way communications - I've
done it several times myself.

>What's the average delivery time for a packet message to go from
>originator to addressee, say between the East and West Coasts?

I dunno. I know that when I connect to the East coast from the West
coast on packet, there's no more delay than when I work the East
coast on CW, which is an apples to apples comparison. How long does
it take the automated CW nets to send messages? ;-)

Never mind, since you're not interested in making informed comments
on the topic.

Dumb analogy because it is a private entity, if for no other reason.

>Hmm..... Many fine people have been excluded from having a pilots license merely
>because they don't know how to fly an airplane, since tests with this criteria
>_are_ in place.

Really dumb anaology as the requirements for a pilots license are
directly justifiable for public and personal safety reasons. That's
not at all true for CW testing.

Source record: 216116

Hi everybody,

If you are reading this, it means that you probably filed the
610-V this Monday, as I did ... and wondering, when (if) we will
get our new calls with less dits and unpronounceable letters.

I wonder, if anybody knows, how FCC processes our applications.
I can imagine, what a huge pile of paper they got on Monday...

As for today, I know, that one of the calls I applied for, is gone.
It was W7AA, my choice # 4, and it was assigned to WB7PJM (congrats,
Nikki!). I am interested, if all my other choices will go that way,
to somebody else, who delivered his application earlier, than my
Early AM Saturday UPS.

If anybody has an idea, how those FCC guys will handle our papers,
please advice. I hate letter B in my call (I used to have it at
the end of my first call UA3AMB -- it was miserable! 10 percent of
folks read it as D). Then in Russia I got RA3AA (not bad... I was
at the right time in the right place), which I proudly keep. I just
wondering, if I will have a chance to have good sounding call here.

Source record: 216117

I set my clocks around the house and on my HP48 calc to WWV every now and then, and the last two times I've tried I could barely hear the announcement of the time due to strong signals of hispanic origin. And it doesn't seem to be a conversation, rather about 5 people talking on top of each other. Today I could hear three distinct conversations.

I've heard of Mexican taxi drivers using 10M, perhaps I misunderstood and it is 10MHz they use to chat with each other?

Kinda weird, I guess if they're close enough the strong WWV signal doesn't bother them. I'd rather talk in a quiet room than at a concert, though! :)

Anyone can learn CW by simple association. Mathematics require a
cognitive ability somewhat different than simple association. Some can do
math, some can do arts, some can do acting, all can learn morse.

BTW: does one need to be taught latin or just learn it to know what Ph.D.
means?

I took some of Cecil's advice and installed a centre fed 102'(+-) wire
with a 34' ladderline 450'. 80m is flat as a pancake across the board.

A few hicups at 10m but I can tune them out. I went up a tree to feed
this ant. Better do it before winter.

Hey, Jim, don't let these guys get you down. They're in a purgatory of frustration at the moment, having good theory but lacking the elemental building block of an adequate (24 bit, 90 MHz) A/D converter for HF. Although you can subsample with lesser converters, that only begs the question since the desired signal must be known to be bandlimited adequately or you get tons of garbage. Without preselection (which is why it begs the question) subsampling will not do wideband .5 - 30 MHz... The logical question is "When will the desired A/D converter be available?" I am still waiting for that answer!

The EM interference at 900 MHz is not to be compared with that at HF. That is one reason that this PCS gear can be made for $1.98 - the required distortion performance is a lot less. I worked on an HF receiver/preselector that had to deal with 100V 10% off-frequency. I have also worked with with HF full duplex, and its essentialy unsolved co-location problems. I don't think UHF has many equivalent situations. Another advantage is that the problem to be solved at 900 MHz is narrowband. Compare the %BW at 900 MHz with the multioctave BW at HF, and it's a different ballgame for many system blocks, such as the synthesizer, front-end filtering, spurious management, etc. The IQ crowd always seem to wind up with a fixed IF to work with -- it must be

nice. Note that in every instance they rely upon analog techniques to give them that fixed IF. Come to think of it, I'm not sure but as I recall 24 bit A/D technology is stuck somewhere down around a sample rate of 10 Hz or so. Maybe more. I dunno.

There is one thing which could make the whole discussion moot, at least to the point of a new receiver design which would at least equal the performance of current designs. That would be if a filter were available which could be tuned and which would provide the desired ultimate selectivity across the HF range at the antenna. In other words, a 2.7 KHz "ideal" filter which could be tuned from .5 to 30 MHz for SSB voice, for example. That would mean that the only signal present would be the desired signal. And that would mean that optimum receiver architecture would be completely redefined. The common problems of today would be in many cases nonexistant. There would no longer be a need for superheterodyning, since the initial problem it solved was to get the desired signal to a low enough frequency (while retaining performance) so that the desired selective filter could be made. So the HF problem would start to look a little more like 900 MHz, eh? One could then use some simple down-conversion technique and be done with it. This filter may come about before the aforesaid A/D becomes available.

So I think you're both right. You point out that the IQ folks have yet to exhibit a fully functional antenna-to-speaker receiver as good as the one on your bench, and you're right. They may never. You also point out that some of the dsp performance today isn't as good as --- but here you're on a slippery slope. The dsp approach can do many things much better than analog design, and can do some things which cannot be done at all in analog. It is the future of radio, and I for one am glad to see this help come. It'll mean exciting design work, and better radios.

Regards, Howard

3762. Opinion on callbooks please

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-25 00:00:00 UTC

I am relatively new to DX QSLing and have had only marginal luck in finding mailing addresses in the on-line QSL "callbooks" such as Buckmaster and QRZ. I'm considering buying a callbook (or CD ROM version) if it provides better coverage. Do any of you have suggestions or opinions on which callbook would be a good purchase? How does the Radio Amateur Callbook (International edition) compare?

73 and many thanks,

Nat Davis

> I can imagine, what a huge pile of paper they got on Monday...

Just thought you might be interested in a conversation I just had with a rep on the FCC consumer info line. She said that all of the Gate 2 apps that were received 9/23 will be entered into the FCC callsign computer system before any calls are assigned. Once all the apps for that day are entered, the computer will randomly select apps, roll through the call choices and assign as appropriate.

She had no idea how many apps were received the first day...just that they are inputting Gate 2 apps into the system as of Wednesday 9/25, and that Mellon Bank is still delivering apps to them that are marked as being received 9/23.

Don't know if this is bull or gospel, but that's what she said.

>This is characteristic of all strong codes.

Yes, that's absolutely right, Phil. But the *first* line of attack
should be even more basic. The RF links should be engineered
with adequate fade margin. The topology of the network should avoid
hidden or exposed terminals. And the basic signal design should
be robust. If you do those things right, you shouldn't need

a particularly strong FEC (with its necessarily high overhead),
and you shouldn't need many ARQ repeats (with their even worse
congestive effect on the network).

Packet operators tend to overlook the basics because the protocols
bandaid the shortcomings of their links. We need to emphasize to
people the importance of getting back to the basics with their
network links. Packeteers shouldn't usually be using VHF/UHF RF
links that they would find unacceptable if they were using them to
link voice repeaters. Just because they can bandaid them with protocol
overhead doesn't mean that they should.

They should reserve those techniques for situations, like the radar
interference you face, or the power limited cases satellite operators
face, where they cannot realistically engineer around them in other more
basic ways. Packet is intended to allow a channel to be shared with many
users, but it is not intended to be a way to compensate for poor RF
engineering.

I recognize that there may be a tradeoff here between FEC and more
traditional RF path engineering. In some cases, FEC allows us to
"short space" links which would normally require enough power to
mutually interfere if we didn't use FEC. So FEC can be a useful
network topology enhancing tool. But we should opt to use it wisely,
understanding *why* we're using it in a particular case, and not as
just an excuse to avoid doing the proper system RF engineering in
the first place.

Well, let's take it from the form so there won't be any invention of new terms. From FCC form 1070V, November, 1995, we have:

"Although feeable applications may be hand delivered to Pittsburgh 24 hours a day, 7 days per week, the formal filing date of an application will be either the date it was delivered, if that day was a regular FCC business day, or the next regular FCC business day, if the delivery day was a weekend or FCC holiday."

Like I said, it doesn't get much clearer than that. The filing date has nothing to do with the date on the application, rather it has only to do with the arrival date (as described above) at the FCC.

Maybe, they do it this way for all of us... We are all should be equal;
but somebody (like W7AA, ex WB7PJM) may be just a little bit more equal
;)

In Russia we used to say "Don't have 100 Rubles, have 100 friends". If
this event
were in Russia, you could be sure, that first 1000 good calls to be
assigned to
FCC officials, their friens, famillies, friens of families, etc. Then,
what remains
(RH5IHS, etc) become available to "the public". Hopefully, it is NOT the
case
in the States.

Let's see... I still have a hope that there will be significantly less
dots
in my future call, hi-hi.

Gene,

Just curious....how did WB7PJM find out he got W7AA? I can't find any web
callsign servers that contain that transaction. Did he call the FCC and
ask? I just spoke with the customer info center again and was told that
"anyone who claims that that they have all ready received a new call under
gate 2 is dreaming".

> in an emergency.

As *radio* amateurs, I wasn't aware we were supposed to train
for using smoke (and mirrors?)

> Most of us do NOT carry equipment capable of combined
> FH/PN spread spectrum communication using
> sophisticated error correction algorithms.

Although it isn't significantly more complex than the keyer
in your rig, and compared to the average new amateur HF
rig these days, it would be a small piece of it. You seem to
forget we use these things called transceivers that are generally
large complex devices.

> I'd like to see you decode FSK by ear...

I've heard of people being able to recognize their call signs over
RTTY. Certainly it is possible, but why bother? Emulating a piece
of hardware may be a goal *you're* proud of, but for me it sounds
like complete and utter make work. I use a modem to post these
followups because whistling at 28,800 bps doesn't seem like a good
use of my time.

> PS:
> If you want to be a sailor you must know how to swim.

Given the number of boating related drownings each year, that
statement is false on its face.

> You may say that you'll be the skipper,

Who if he does his job, no one will be swimming that doesn't want to be swimming.

Red Herring Alert!

In case you hadn't noticed, the logic applied by the anti-code-test crowd can as easily be applied to theory examinations as well. The fact that someone hasn't done it yet is irrelevant (although I think there was someone a year ago who was calling for abolition of theory exams too.)

Jim, please try hard to concentrate on this:

No one, not me or anyone else, wrote anything about any significance
being attached to the date written on the application form. What I
had written, and what you had earlier taken issue with, was this:

In article <843497395snz@microvst.demon.co.uk>
tgold@panix.com "Anthony R. Gold" writes:

> No they never said any such thing. The filing date of the
> application is the date of arrival it arrives on a non-holiday week
> day. Otherwise, the filing date is the next non-holiday week day
> following the date of arrival.
>
> Only premature filing, i.e. a filing with a filing date prior to the
> start of the applicable Gate, will result in rejection and return of
> the application, not premature arival.

Please don't argue against what no one has said, it's a waste of
time. If you can still find any fault whatever with what I really did
write, please try again to explain your problem.

And as this is now beaten way past its death, perhaps taking this to
email is appropriate?

Followup set.

Hi, I am totally new to any of the radio wave stuff... and I have a lot of specific questions about it.

Is there a newsgroup that deals with radar?

I want to learn more about the functions and propertys of radar systems, about how array radar works (and possably any other array methods of measuring radio waves), and about any possable ways of sorting/measuring a range of radio wave frequencys continously.

Any good (easy to understand) books on these subjects anyone can e-mail me a list of?

Thanks for your time...

> ;)

Perhaps you don't know English all that well, but let me tell you
that you are now implying that the callsign which you wanted was
awarded improperly because WB7PJM had an unfair advantage over you.
There is no evidence that this call was even awarded under Gate 2,
and indeed all of the evidence is directly against that.

I am sorry you previously had such unhappy experiences in Russia, but
please control your imagination and do not assume that everywhere is
equally as corrupt as your previous homeland used to be.

Good luck with whatever the Gate 2 lottery gets you.

Regards,

>After talking to Kinko's, I'm quit shocked what they want to make 3X5
>QSL cards. A mininum of 100 at 41 cents EACH! Price drops to 18 cents
>each for 1000 ... thats $181!

>I bought some heavy duty paper, but dread cutting out these things.

>Any Ideas?

This can't be right unless you are having something fancy done on
scented paper. If you give them the template they will make cards
for about 3 cents apiece. I had nearly 5000 printed there for HC8N
and it was under $200.

They are not great cards, but they are cards, and I use them for
buro replies. The color photo cards go to those who send direct
requests (and even they are under 10 cents each).

I never have had my radio toys checked, but once a CATV converter
was checked. I couldn't show it worked standing there, especially
without AC. Also, one terminal only in the Buffalo airport always had
to open and look at every roll of film I had. One idiot even wanted
me to open the camera with film in it.

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 25/2330Z SEPTEMBER 1996 BY IPS RADIO AND SPACE SERVICES
FROM THE AUSTRALIAN SPACE FORECAST CENTRE
SUMMARY FOR 25 SEPTEMBER AND FORECAST FOR 26 SEPTEMBER - 28 SEPTEMBER

1A. SOLAR SUMMARY
Activity: Very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 71/6

GOES satellite data for 24 Sep
Daily Proton Fluence >1 MeV: 1.3E+06
Daily Proton Fluence >10 MeV: 1.9E+04
Daily Electron Fluence >2 MeV: 9.3E+08 (high)
X-ray background: A1.9
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
26 Sep 27 Sep 28 Sep
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 26 Sep: 71/6

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: Unsettled to active

Estimated Indices : A K Observed A Index 24 Sep
Learmonth 13 3233 4322
Fredericksburg 15 9
Planetary 20 7

Observed Kp for 24 Sep: 3223 2222

2B. MAGNETIC FORECAST
Date Ap Conditions
26 Sep 20 Unsettled to active, with the chance of minor
storm periods.
27 Sep 15 Unsettled
28 Sep 10 Unsettled
COMMENT: IPS Geomagnetic Warning 10 was issued on 19 September
and is current for interval 23-26 September.

3A. GLOBAL HF PROPAGATION SUMMARY
Latitude Band
Date Low Middle High
25 Sep Normal-fair Normal Normal-fair
PCA Event : None

3B. GLOBAL HF PROPAGATION FORECAST
Latitude Band
Date Low Middle High
26 Sep Fair Normal Normal-fair
27 Sep Fair Normal Normal-fair
28 Sep Fair Normal Normal-fair

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Date T index
25 Sep 3

Observed Australian Regional MUFs:
Darwin: Depressed up to 30% for the period 02-07UT,
otherwise near predicted monthly values.
Townsville: Depressed up to 20% for the period 02-06UT,
otherwise near predicted monthly values.
Sydney and Hobart: Near predicted monthly values.
Some spread F was observed during local night at Darwin.

Predicted Monthly T index for September: 9

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
Date T index MUFs
26 Sep -5 Depressed up to 20% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.
27 Sep 0 Depressed up to 20% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.
28 Sep 0 Depressed up to 20% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.

3788. Need help understanding tower lighting

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-25 00:00:00 UTC
From: sidener@halley.cc.umr.edu
Message-ID: <52cg4r$8ao@hptemp1.cc.umr.edu>
Source record: 216151

Hi, I am about to put up a 100 foot freestanding tower on my property.

There currently is a commercial tower the same hight only 1 mile from where I live and it has red flashing lights half way up and on top.

First, I was wondering what the different light configurations on towers mean? Sometimes you see red lights (solid or blinking) or white lights (solid or blinking) sometimes all of the lights on a tower are the same color and sometimes they alternate. Sometimes the towers are painted red and white and other times they are not.

Can anyone give me the rhyme or reason for this?

Secondly, Do I have to put lights on my tower?

Any help would be appreciated.

Thanks,

Scott Sidener

He probably didn't. But anybody with internet access can retrieve the
files from FCC ftp site

ftp://ftp.fcc.gov/pub/XFS_AlphaTest/amateur/

and analyze them. FCC (and I must admit, those guys do a really GREAT
job)
posts the files containing all the issued licenses daily. I just picked
the file tue.zip -- it was there...

>Although you can subsample with lesser converters, that only begs the
>question since the desired signal must be known to be bandlimited
>adequately or you get tons of garbage.

The aforementioned A/D converter is NOT necessary to build an effective
DSP-based radio system from HF ...

You're postulating a system that could (conceivably) sample directly at
the antenna ... not necessarily the best way to do things ... for a
number of reasons ...

and you don't have to subsample ...

>MHz... The logical question is "When will the desired A/D converter be
>available?" I am still waiting for that answer!
>

The logical question is "Why wait?" (Implement the system in a more
sensible fashion with available technology.

>The EM interference at 900 MHz is not to be compared with that
>at HF.

There's still a big "near-far" problem to contend with ... lots of
dynamic range needed for good performance ...

>There is one thing which could make the whole discussion moot, at least
>to the point of a new receiver design which would at least equal the
>performance of current designs. That would be if a filter were
>available which could be tuned and which would provide the desired
>ultimate selectivity across the HF range at the antenna. In other
>words, a 2.7 KHz "ideal" filter which could be tuned from .5 to 30 MHz
>for SSB voice, for example.

Such a filter exists ... it's called the Weaver architecture ... but its
implementation takes you directly to baseband, so you might as well just
do a few more desirable things and finish the demod process, rather than
converting back to RF ...

(We're getting into areas that are covered by my patents, so I've
had this conversation a few times before ...)

>And that would mean that optimum
>receiver architecture would be completely redefined.

Been there ... done that ... got the patents ... does multiple modes, eliminates mobile multipath impariments when used at VHF/UHF, provides frequency tracking and other benefits at HF ... (want to license it?)

>The common
>problems of today would be in many cases nonexistant. There would no
>longer be a need for superheterodyning, since the initial problem it
>solved was to get the desired signal to a low enough frequency (while
>retaining performance) so that the desired selective filter could be
>made.

There is no longer a need for the superhet ... the ideal "IF" frequency is baseband ...

3791. FS:DC Plugs:Kenw,Icom,Alinco,Yaesu

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-25 00:00:00 UTC
From: n2cjj@undefined
Message-ID: <1996Sep25.205000.1698720@undefined>
Source record: 216154
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.swap

I have found a source for those DC power cord plugs. The ones I've got
have 6 pins, male plastic with metal female (barbed) inserts.

The plug fits most 12VDC HF radios:
Icom 720, 735, 706..and alike, newer Yaesu and Alinco DX70.
Kenwood-TS120, 130, 140..430, 440, 450..850,..TS50,60, 660, 670...and alike.

Make your own power cord yourself, YOUR WAY!
Crimp or solder, long or short, heavy gauge wire, purple with polka-dots...

I'm offering the 6 position plug with 6 inserts for $4 each,
or the deal 3 for $10. All prices include postage in the US.

To order, kindly send a check to:

R. Langston
286 Hudson Street
Cornwall-on-Hudson, N.Y. 12520

You can also email me for info at: n2cjj@ibm.net

It's a great deal if you use one rig at home, in the car and at work and
are stuck dragging one power cord all over....

I still can't believe AES, HRO and others get $30 for a power cord. HiHi!

Well folks the results are in! After observing the stats of the
downloaded FCC database with which Microsoft Access, Foxpro,
etc...were used we now know that 78%.....I say again 78% of the U.S.
Amateur Radio operator population is of the coded variety. Only 22%
of the hams are no code technicians. That is 1/5th. I think the
numbers of no-coders will have to grow for there to a significant
impact here.

Now, realistically not everyone of that 78% is active...but I bet
neither is the entire 22% of the uncoded population.

What say ye naysayers about that?

==========
cheers! Jim Martin, wk1v

>appropriately lower power levels, so the overall occupancy is much lower.
>

I disagree that "the relevant metric is spectrum*space per conversation"
as you put it ... that panders to the "narrower is better" concept,
which is not really an absolute by any stretch of the imagination ...

and I didn't say "bit rate" ... I said "bits/sec/Hz", which is a
measure of spectral efficiency of information transport ....

Just because CW transmissions are narrower, doesn't mean that they are
more efficient ...

>I'd suggest that you read my paper in the 7th ARRL CNC.

JR>Of course I meant to type $10,000 to $15,000 for these prices!
JR>And, yes, they are shocking.

JR>But Mahalo to you Gary for your excellent explanation of the coming
JR>digital techniques; I truly hope they are not to far out into the
JR>future. Any chance before the next propogation peaks just
JR>past the century turn? Only 5 or 6 more years. Clearly I do
JR>not have the background to participate any further in this level
JR>of technical discussion; my degrees, were in, of all things,
JR>vacuum tube technology learned at Stanford in the mid 1950's!

I've started in the vacuum tube era and had to make the transition to
semiconductors by myself at own time and expense after 1960. The entire
world of electronics keeps changing whether we want it or not.

Right now, speaking about receivers, I would invite you to look at the
increasing market in SW receivers. The Grundig Yacht Boy YB500 is a
HF communications receiver that fits IN a shirt pocket. Opening it up,
the insides are nothing like the classical vacuum tube architecture
style that was copied for "communications receivers" into the 1990s.
In the scanner radio market I can buy (from two different manufacturers,
wallet willing) communications receivers that tune continuously from 10
KHz to 2 GHz less only the blocked cellular phone channels! The
now-conventional cellular telephone is nothing like the classical
VHF-UHF FM HT and the European digital cell phones (different system)
are more different. Wireless LAN links have NO ties to classical
receiver structure, yet must operate in heavy RF noise environments,
unattended. The frequency-hopping spread spectrum radio is perhaps the
strangest of all, capable of operating in any spectrum from HF into
microwaves, allowing more users with less mutual interference than in
any of today's amateur band environments.

The entire field of communications has changed, is changing, and will
continue to change. Keeping up with the changes requires constant
personal effort.

JR>You know, TWT's, Beam Parametric Amplifiers (the Adler tube from

Travelling Wave Tubes are among the last of the vacuum tubes to continue existance. High power transmitting tubes are still there. The TV and computer CRTs already have color LCD flat screens in competition. A "palm top" portable TV color receiver can be purchased in any consumer electronics store for less than $200...it has the bulk of an old Standard Coil turret tuner without the shaft.

The digital technology AND analog technology advances have given everyone a chance to have more features, better features in anything electronic. In another newsgroup I've seen a statement that amateur radio communications should be limited to what "it was born with." That's a terribly conservative attitude. I am glad that you are still flexible of mind to be interested in what we all have available.

By the way, ever notice that the full acronym for Travelling Wave Amplifier Tube hasn't been used? :)

>some spectrally efficient hardware, FM folks are bleeding into the weak signal
>segments.
>

The commercial land mobile people will no longer be able to use the
current "narrowband" FM in a short time ... new radios are being
mandated to meet tougher spectral efficiency standards in order to be
type-accepted ... we're falling behind all over ...

>So, Carl, we've had five years of codefree licensing in the VHF bands. Where
>is the new hardware? Where are those technical people who in theory are being
>kept from doing neat stuff? Unless you can demonstrate success in this area,
>you can't claim that anything will be different on HF.

>> So have I ...
>
>Actually, no, you havn't been, but that's also irrelevant.
>
So since 1975 is not "a long time???" What do *you* consider a "long
time?"

>> From what you said, it appears that it's grounded in "if we let more
>> people in, the bands will be too crowded (and you don't want to "share
>> the wealth") ...
>

>It's not a question of sharing the wealth. It's a question of functionality.
>It's the reason why you don't pack tons of people into elevators, or put a
>waterbed in an old house -- the system breaks and is useful by no one. The
>utility of amateur radio as a backup national emergency communcations system
>is far, far more important (from a legislative standpoint) than doing the
>newest, neatest thing. That's not to say that technology development isn't
>important, but it is secondary as far as Congress is concerned.
>

Getting new people in in quantities is not "packing tons of people into
elevators" ... there is no "system" ... and nothing's going to break ...
except the hearts of the adamant pro-coders who'll finally have to face
the fact that CW is backward technology in today's world ...

The utility of amateur radio as a backup national emergency
communications system is, sadly, *already* a joke ... we need to fix
that ... clinging to 1930s technology is NOT the way to fix that ...

The dumping down of Amatuer Radio; Lower the standards for entry into the hobby.
Then what we will have is a bunch of ill-prepared operators, when the situation really gets bad.
Will you be able to operate CW, when your "new" rig died in the EMP of a terrorist nucular strike ?
Will you be able to build "from scratch", a dipole for any band, after you gear & anttenas were blown away by
a hurricane ?
Will you be able to handle all the folks that need help & want info transmitted to a distant location ?
Will you have what it takes to operate for 24 or 48 hrs, on battery power, with no help ?
Will these "new guys" be able to handle, what hams have done for over 50 yrs., in time of dire need ?

You will need a tuner to match the antenna to your transmitter. Perhaps
if you could make it a dipole instead, fed by ladder line, to a tuner, you
might be better off? Still pretty inexpensive.

A few times I traveled on business (construction) and my associates and I carried portables. Security just looked at them (remember that they had to manually carry them around the metal detector gate) and didn't even ask, ever, not even once, for us to demonstrate their functionality.

I would have certainly felt better if they at least told us to make sure to not
use them on the plane!

Message-ID: <KCRADY.96Sep24222832@polaris.cv.nrao.edu>
Source record: 216197

Greetings,

I am hoping someone out there can point me in the direction of finding specifications on the CTSS tones many repeaters are using today.

I already have the frequency lists and Motorola two-letter designations; what I really want is the specs. on frequency tolerances, whether the signal must be sine wave, etc. and the upper and lower amplitude limits, if any.

In other words, I want to design a CTSS add-on to an old 2M rig. The local tone is 88.5 Hz. What guidelines should keep in mind?

everyone uses a similar sticker these days. was interesting in one R7 installation
where there was a sticker on each of the short, thin, elements mounted near the
matching network to serve as a warning plus warn of a tripping hazard.

eggs are high in cholesteral and I don't eat them. You, one of the
professed code haters bite the bullet, took the 13wpm code and upgraded
to advanced. For that, a tip of the hat. That shows initiative, something Carl
(20wpm in his head and a techplus for 21+ years) lacks.

That in my book is a-ok. Just curious?? what made you decide?? was it lack
of anything on the 10meter bands?? a new radio??? the dx bug bite???

BTW, don't take everything you read so personal. And the word is
ASSUM *P* TION. If you are going to chastise someone for spelling
make sure YOU don't make mistakes...it dilutes the insult.

Gary,

you forgot that OOK Morse code is the only
DIGITAL code that can be received by no other
signal processor than a brain. Plus, it's the simplest
communication (besides radio, you can use a flashlight,
whistle, smoke, you name it!). That can be important
in an emergency.
Most of us do NOT carry equipment capable of combined
FH/PN spread spectrum communication using
sophisticated error correction algorithms.

I'd like to see you decode FSK by ear...

> But, you say, you need an encoder and decoder to do FSK.
> Yes, you do, but you also need one to do manual OOK Morse.

Hi Steve.

Just some words to the wise about Gerry...

He is a childish bigot, who thrives on trolling and insults.

He never has any good input for the group, and if he does, its after the fact, when someone calls him on it.

The most interesting and funny things about Gerry, are the facts that he wishes to reserve the right to speak what HE wants...but doesnt want anybody else to have that right. Further, Gerry will call names, make insults, lie, and back stab you...then the next day call someone ELSE an embarresment and disgrace to ham radio.

Gerry has contacted my employeer, in an effort to get me fired because of what I post here.

He has lied about postings I made to fit his own agenda of discrediting me, by claiming that I post to a homosexual newsgroup, and other things.

He has stated "...I can make things very rough for you if I want."

And, "..how about if I forward everything that you post to your boss at work..."

These are just a few of Gerry's doings Steve.

My advice to you...?

HE is the true embarresment and disgrace to this hobby...

HE is the one who insults all of us by thinking that we are too stupid to remember all his trolls and attacks...

HE is the newbie, that came in hurling insults, and has nothing good for the group...

HE is the one who will contact your employeer when he doesnt like what
you post...

Ignore him Steve...hes not worth it.

Take care.

PS. I have been trying to email you, but it keeps bouncing back with the last
address I had of yours...did something change?

True in a sense. But it also helps if you have some smarts about it and don't
tip your hand. How do you think they catch most cable pirates? It's either
through a friend (or ex-friend actually) that turns them in our they're
stupid enough to believe the free offers that cable providers run.

Actually it will, but you have to manually feed the stock in, rather than
use the paper tray. Some compatibles also allow you to open an output in
the back of the printer so the stock doesn't bend at all.

Also "www.qrz.com" carries the daily FCC report, and integrates that info into their overall database for immediate on-line searching. They also include lattitude and longitude of the control point, and can provide bearing and distance to Zizp code areas.

3819. FCC Vanity Gate 2 - FCC Day-One (September 23rd) Receipts Status to Date

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-26 00:00:00 UTC
From: "Bart Jahnke, KB9NM ARRL/VEC" <vec@arrl.org>
Message-ID: <324AD71C.3A11@arrl.org>
Source record: 216011

FCC Vanity Gate 2 - FCC Day-One (September 23rd) Receipts Status to Date

FCC Gettysburg reports today that they have received to date from Mellon Bank 4,184 paper applications that were filed as of September 23rd--day one of Vanity Gate 2 (the gate which opened for Extra class licensees and Extra class club license trustees). FCC also reports receiving 339 electronically-filed Gate 2, day-one applications.

This brings the total of Gate 2, day-one receipts to 4,523 (to date).

Note: This may NOT yet be the total Gate 2, day-one receipts from Mellon Bank. FCC says it has not yet begun receiving September 24th applications from Mellon Bank--so more September 23rd receipts may still be forthcoming. This should, however, represent the total of all electronically-filed Gate 2, day-one (September 23rd) receipts.

FCC said that new Vanity call sign grants for Gate 2 may be forthcoming in about two weeks--depending in part on the final total number of applications that were filed for Vanity Gate 2, day-one receipt.

FCC once again reaffirms that NO Gate 2 call-sign grants will occur until ALL day-one receipts are entered into their system queue--and at such time they will begin making grants from the queue in a random sequence. FCC also confirms that NO Vanity Gate 2 grants have occurred to date (checking with the FCC on scattered rumored grants have so far shown them to all be Gate 1 applications, or non-existent [BJJ]).

For an example of the Vanity application flow at FCC, here are Vanity Gate 1 and Gate 1A receipt numbers for the 9 business days prior to September 23rd:

Date Receipts
9-10 51
9-11 15
9-12 24
9-13 20
9-16 43
9-17 9
9-18 35
9-19 51
9-20 161

From: prografx@teleport.com
Message-ID: <52enba$pd1@nadine.teleport.com>
Source record: 216012

Just as a prologue to my original question:

My friend took his test Sunday 9/22/96, the application was filed in
a group electronically with the FCC Sunday night or Monday morning,
and the license was processed, call sign issued, and results posted on
the Internet by 0600 Thursday Zulu (11PM Wednesday local) 9/26/96!

That is incredible compared to the "olden" days!

>
> Gary
> --Hi Gary,

I was using the term "obsolete" in the sense of those who describe morse as "obsolete". In fact, you are correct in saying that radio will not likely become obsolete in the near future, in the true sense of the word, as in "not used" anymore. I never said wire technology would replace radio. I said "even the most advanced SS HF radio amateur modes will be obsolete by comparison of cost/performance".

I was simply making the point that technology is relative. Is AM superseded by SSB? Is RTTY superseded by PACTOR? Supersede is defined as "cause to be set aside, to force out of use as inferior". My point is this: AM is still being used, ergo, it has not been superseded by SSB. RTTY is still being used, ergo, it has not been superseded by PACTOR. Morse is still being used, ergo, it has not been superseded by some other mode.

73, and thanks for your post.

Hey I must be a crude dude because I enjoy CW to no end. All that
is old is not necessarily outdated, and I've found that to be
the case with CW. What a neat mode; narrow-band enough to shine
under almost any conditions, accessible to everyone who knows the
code, even people using homebrew rigs or WWII surplus equipment,
no expensive terminal node equipment or computers required,
OK to take mobile, and with enough standard abbreviations that we
can make contact across language barriers.

Oh yeah: AM, FM, SSB, RTTY and AMTOR are nice too.

> Alan KJ5ZD If you go into the Control Panel in Windows 3.1, you'll see an icon called International. Double-Click on this and it will bring up the international setting window. In the lower left-hand corner, there is a box called Time Settings. Click on the change button and there is a radio button that will let you toggle between 12 and 24 hour formats. This should help you out if you are running the Windows clock in "digital" mode. Of course this will only help if you only want to display one time zone. Hope this helps.

Recently, there have been some freebie offers posted on this newsgroup. In that same giving spirit I would like to offer you an almost free copy of National Scanning. I say almost free because it will cost you two quarters for postage. National Scanning is published every other month and includes such top writers as Tom Swisher, Gene Hughes, Larry Miller, etc.

And yes there are a few catches......aren't there always?

First, this offer is good for non-subscribers only. Second, please send the two quarters, not a check (more trouble than its worth if it bounces) Third, the magazines will be sent via bulk mail with the next issue after your 50 cents arrives.

To take advantage of this offer send 50 cents to:
National Scanning
P.O. Box 360
Wagontown, PA 19376

In article <51do8l$qev@krypto.zippo.com> cecilp@magic.bunt.com (Paul Cecil) writes:
>Change the band plan? For what and how?

Bandplans should not be static. They should change and evolve as
usage patterns and technical advancements dictate. This should be
an ongoing process, and not something set in government cement.
I'd suggest that amateurs themselves should evolve their own
bandplans, perhaps through international amateur organizations
like the IARU, and review them frequently to make sure that they
remain consonant with reality.

>Change >the test? To what?

To something that meets the legitimate concerns of the appropriate
government licensing agency. No more, no less. Those concerns retain
certain basic facets consonant with knowledge of regulations and
radio theory, but they also have facets such as Morse speed testing
which are no longer a legitimate government concern since the basis
for that concern has disappeared, IE there no longer exists a need
to interoperate with life safety services who only have Morse capability
because life safety services no longer retain a Morse capability.

>There must be some way of making someone earn the right to be a HAM.

Why? What legitimate government statutory purpose is served by
fraternity hazing? Note, the Communications Act of 1934 (as amended)
is the governing statute in this regard. Read Section 1 and see if
you can justify an "earn the right" attitude based on that. The
government has no reason to care one way or another how much effort
an applicant may have to exert. The government only has legitimate
reason to care that the applicant satisfies their legitimate concerns,
as defined in Section 303. If that takes a lot of effort on the part
of an applicant, so be it, or if it takes very little effort on the
part of another applicant, so be that too. Effort is irrelevant. Only
results count.

>I see the code
>as the final hurdle to graduation.You, Carl, and the others may be
>right that the Code will go away. But what do you intend to use as a
>final hurdle. If you give away the Amateur Radio License then why
>should anyone respect it.

An amateur license isn't a graduation certificate. It is an entrance
exam granting access to the lifelong learning laboratory which is
amateur radio. As such, it must determine that the applicant can
work in the laboratory safely and without harming others. That requires

certain prerequisite knowledge (and IMHO considerably more than is currently covered on the amateur exams, for certain more than is covered by the Novice, Tech, or General exams). Beyond that, the lab work is self-paced and self-directed, and the only graduation certificate is issued by the coroner.

A license is a tool to be used, today and tommorrow. It is not a dusty trophy on a shelf, a rememberance of efforts once exerted. A workman respects a good tool for what it allows him to do, not for what it may have cost to obtain. I've bought some very costly tools over the years for which I hold very little respect because they turned out not to be very good tools. OTOH, I've found tools by the roadside which I prize very highly because they turned out to be very good and useful tools. What I may have paid doesn't matter, what they are worth is a function of what they allow me to do. An amateur license is no different. I prize my license not for some test I took in 1963, but for what it allows me to do today and tommorrow.

If you feel differently, then I suggest you turn in your lab pass and go sit in the sun with the other has beens and used to be's and remember your past glory of once having passed a test. If that's what the license means to you, just a dusty trophy of some past glory, if you think the time for doing and learning is over, if you think you've graduated, then you've no business still being in the lab.

Funny, we call it calculating impedance. :-)

>And that's too easy. Let's get some
>engineering mathematics involved.

Like Ohm's Law, hmmm? Oooh that's tough. I remember you demanding
the tests require applicants to actually demonstrate that they can
multiply and divide by hand using that heavy duty engineering equation.
That's *real* tough.

If you're really serious, lets make them determine the coefficients for
an 8th order Chebyshev FIR filter with a specified center frequency,
passband, and stopband ripple. Now that might be useful. Or we could
have them write out the equation describing the modulation function
due to keying a carrier on and off (bet you can't, and you claim to
understand your radios), and use it to express the occupied bandwidth
at a specific baud using the ARRL recomended rise/fall times. Then
express that as a percentage of the Shannon limit for the given
information rate (bet you can't do that either).

>Let's bring back circuit diagrams that
>the examinee must sketch.

Oh sure, mechanical drawing. I suppose you want them done in ink
with a quill pen too. Better would be to require them to write a
Spice model for the circuit and do a transient analysis of it.
You've so consistently spurned modern engineering methods and tools,
Jeff, that one has to wonder if you'd recognize one if it bit you.
Is your knowledge as stone age as the components you insist must be
used in order to qualify as homebrew? One wonders.

ARRL Bulletin 65 ARLB065
From ARRL Headquarters
Newington CT September 26, 1996
To all radio amateurs

SB QST ARL ARLB065
ARLB065 Gate 2 like a lottery

September 23, 1996, was a momentous day for the thousands of FCC Extra Class licensees who decided to enter what amounts to a call sign lottery--otherwise known as Gate 2 of the FCC's vanity call sign program. To paraphrase the old saw, you pays your 30 dollars and takes your chances. But, patience. Don't be surprised if that license bearing the new call sign doesn't show up for two to three weeks or longer, even if your Form 610V was among the first to arrive at the FCC bank contractor's doorstep.

Some applicants--perhaps many--labored under the misconception that the earlier they got their Form 610V in to the Pittsburgh drop box (for Mellon Bank, the FCC's fiscal agent), the better their chances of getting their first choice. T'ain't so. According to ARRL/VEC Manager Bart Jahnke, KB9NM, the FCC says it won't grant any applications until all applications (electronic or hard-copy) have been received. ''What this means is all applications first will be entered into one big queue in no particular order in the FCC's computer,'' he said. Electronic filers using the system that the FCC inaugurated on September 23 stand the same chances as paper filers in the call sign assignment process, Jahnke emphasized. The FCC's on-line filing system does not yet permit on-line payment, so electronic filers still had to physically send their payments to the FCC's drop box in Pittsburgh, although the box was a different one than for paper applications with payment attached.

Jahnke explains that no application will carry a time of receipt, and everything that showed up in the correct Post Office box between 12:01 AM on Saturday, September 21, and 12:59 PM on Monday, September 23, will be considered day-one receipts and will go into the computer as such. The FCC says it won't start to grant new call signs until all applications for a given day are entered--whether they were filed on paper or electronically. When the FCC starts

granting new call sign requests, they will be done in random order, so it could be a few weeks before your application is granted.

''Think of it as a lottery drawing,'' Jahnke said. ''The (FCC computer) 'arm' will reach in and grab applications until the queue is empty.''

Just how many Gate 2 applications the FCC ultimately will receive is a matter of speculation. Original FCC plans called for running off 25,000 Form 610V copies for the entire vanity program. Later, the Commission upped the tally by nearly a factor of 10. Jahnke said the ARRL alone has distributed up to 20,000 vanity call sign application packages, including direct replies to SASEs, electronic requests and distributions at hamfests and conventions.

: > Maybe, they do it this way for all of us... We are all should be equal;
: > but somebody (like W7AA, ex WB7PJM) may be just a little bit more equal

: Just curious....how did WB7PJM find out he got W7AA? I can't find any web
: callsign servers that contain that transaction. Did he call the FCC and
: ask? I just spoke with the customer info center again and was told that
: "anyone who claims that that they have all ready received a new call under
: gate 2 is dreaming".

W7AA was my first choice :-(; one down and twentyfour to go.

I downloaded the "tue.zip" file from the FCC ftp site and found a "B" code
for the call award for W7AA-- "close relative". Probably a third cousin
or something, but it is nice to see a pioneer call like that stay in a
family rather than get snarfed up by some club station you never hear on
the air. The awardee appears to have gotten her ("Nikki" sounds YL ?)
Extra just barely in time.

Meanwhile, this means that the FCC still has its thumb inserted-- this
wasn't a Gate 2 award. Close relatives were and are Gate 1.

Did the FCC consumer contact indicate when Gate 2 work would start
happening?

Regards,

Tom

GATE 2 IS LIKE A CALL SIGN LOTTERY

September 23, 1996, was a momentous day for the thousands of FCC Extra class licensees who decided to enter what amounts to a call sign lottery--otherwise known as Gate 2 of the FCC's vanity call sign program. To paraphrase the old saw, "you pays your $30 and takes your chances!" But, have patience! Don't be surprised if that license bearing your new call sign doesn't show up for two to three weeks or longer, even if your Form 610V was among the first to arrive at the FCC bank contractor's doorstep.

Some applicants--perhaps many--labored under the misconception that the earlier they got their Form 610V in to the Pittsburgh drop box (for Mellon Bank, the FCC's fiscal agent), the better their chances of getting their first choice. T'ain't so! According to ARRL/VEC Manager Bart Jahnke, KB9NM, the FCC says it won't grant any applications until all applications (electronic or hard-copy) have been received. "What this means is all applications first will be entered into one big queue in no particular order in the FCC's computer," he said. Electronic filers using the system that the FCC inaugurated on September 23 stand the same chances as paper filers in the call sign assignment process, Jahnke emphasized. The FCC's on-line filing system does not yet permit on-line payment, so electronic filers still had to physically send their payments to the FCC's drop box in Pittsburgh, although the box was a different one than for paper applications with payment attached.

Jahnke explains that no application will carry a time of receipt, and everything that showed up in the correct Post Office box between 12:01 AM on Saturday, September 21, and 11:59 PM on Monday, September 23, will be

considered day-one receipts and will go into the computer as such. The FCC says it won't start to grant new call signs until all applications for a given day are entered--whether they were filed on paper or electronically. When the FCC starts granting new call sign requests, they will be done in random order, so it could be a few weeks before your application is granted.

"Think of it as a lottery drawing," Jahnke said. "The (FCC computer) 'arm' will reach in and grab applications until the queue is empty."

Late information indicates that as of September 26, more than 4500 vanity applications had made their way from Pittsburgh to Gettysburg for processing, but more are expected. The FCC got 339 electronically filed applications on day one. Just how many Gate 2 applications the FCC ultimately will receive is a matter of speculation. Original FCC plans called for running off 25,000 Form 610V copies for the entire vanity program. Later, the Commission upped the tally by nearly a factor of 10. Jahnke said the ARRL alone has distributed up to 20,000 vanity call sign application packages, including direct replies to SASEs, electronic requests and distributions at hamfests and conventions. One unconfirmed report said a single courier hand-delivered 5000 Form 610V applications on behalf of first-day filers.

ANOTHER SUCCESSFUL SAREX MISSION

The three hams aboard space shuttle Atlantis--Jay Apt, N5QWL; Carl Walz, KC5TIE; and John Blaha, KC5TZQ--spoke with students at two schools in the Midwest and a third in England during their mission, which ended Thursday, September 26. Blaha replaced Shannon Lucid aboard the space station Mir, where he'll spend 120 days. Lucid had been living on Mir for the last six months. The shuttle had docked with the station last week to make the exchange and to drop off food, water, equipment and supplies at Mir.

STS-79 carried the Shuttle Amateur Radio EXperiment (SAREX) payload in configuration M (voice-only operations).

While still docked with Mir, the Atlantis crew successfully completed three prearranged SAREX contacts. The first was on Friday, September 20, with Immaculate Conception Elementary School in Celina, Ohio. Pupils there made a very successful SAREX contact with astronaut Carl Walz, KC5TIE. Eleven-year-old Steven Eizensmits, KC8ENC, of Mendon, Ohio, initiated the 6 1/2-minute contact, and pupils got answers to nine questions as some 400 of their classmates and media representatives looked on (nine TV and cable stations, two radio stations and one newspaper sent reporters). Also among the crowd were the mayor of Celina and a couple of members of the Ohio legislature. After the contact, the pupils got a congratulatory telephone call from retired astronaut and US Senator John H. Glenn Jr--the first American to orbit the Earth.

Crew members spoke with two schools on Sunday, September 22. Students at the Royal School For Girls in Haslemere, Surrey, England, got answers to four questions during the QSO. Audio quality was reported as "somewhat poor," but students thought the event was "pretty keen." Some 150 people showed up for

the occasion, including representatives from the BBC and local television.

The last SAREX contact was with Andover Middle School in Andover, Kansas. Students and administrators at the school called the contact a "once-in-a-lifetime" opportunity. Audio quality was adequate, and students asked a couple of dozen questions, most of them fielded by Jay Apt, N5QWL. At the school itself, some 200 people and media representatives turned out.

After the Kansas contact, the crew members turned their attention to personal contacts. The ARRL has received dozens of reports from amateurs who made successful contact with the crew throughout the mission. We even got reports from hams in Canada and Finland. After Atlantis and Mir separated, John Blaha, KC5TZQ, was heard working ground stations on the East Coast on 145.55 MHz. "Good strong signal as Mir passed over Knoxville," reported Greg Williams, KE4HSM.

Send STS-79 QSL cards and reports to: ARRL EAD, STS-79 QSL, 225 Main St, Newington, CT 06111-1494. Include the following information in your QSL or report: STS-79, date, time in UTC, frequency and mode. Include a stamped, self-addressed business-size envelope if you wish to receive a card (non-US stations should include one IRC). The Bergen Amateur Radio Association in New Jersey has graciously volunteered to manage the mailing for this mission.

Space shuttle Columbia will carry the next SAREX payload, during mission STS-83 in March, 1997.

FCC PLAN WOULD EASE INTERNATIONAL OPERATING

The FCC has proposed amending the Amateur Radio rules to make it easier for hams holding a European Conference of Postal and Telecommunications Administrations (CEPT) radio-amateur license or an International Amateur Radio Permit (IARP) from certain countries in Europe and the Americas to operate during short visits to the US. If finally approved, hams would be able to operate for short periods in participating countries without first obtaining another license or permit from the host country.

The FCC says the arrangement is intended to make it easier for US hams to operate stations temporarily in several countries in Europe, Central and South America. Likewise, hams from those countries would be allowed to operate in stations in places where the FCC regulates ham radio. "We believe that US participation in both the CEPT agreement and the CITEL/Amateur Convention would benefit US amateur operators who travel to Europe and to the Americas," the FCC said in its discussion of WT Docket 96-188.

Operating authority by CEPT or IARP holders in the US would be for "up to 180 days within the preceding five years." The two classes of CEPT licenses would correspond either to Amateur Extra or Technician class. Resident aliens or US citizens could not operate in the US under a CEPT license or IARP.

Last year, ARRL petitioned the FCC to implement the CITEL/Amateur Convention. The League also asked the Commission to acknowledge arrangements

to be made between the ARRL and the Department of State to issue IARP documents to US citizens for use in other CITEL countries. The FCC has asked the State Department to apply for participation in the CEPT Agreement as a non-CEPT country and expects the agreement to be concluded this year.

Comments on the proposal are due December 13, 1996, and reply comments by January 13, 1997. E-mail comments should mention "WT Docket No 96-188" on the subject line and should be addressed to mdepont@fcc.gov. Include your full name and Postal Service mailing address in the message text. Mail written comments to: Office of the Secretary, Federal Communications Commission, Washington, DC 20554.--FCC

ARVID H. ANDERSON, W1RRS, SK

Arvid Anderson, W1RRS, of New Britain, Connecticut, died September 2, 1996. He was 96. Anderson, a retired employee of the Connecticut Light and Power Company, was among those who--decades ago--helped to install the power poles used to support a large rhombic antenna for W1AW on the site now occupied by the ARRL HQ building. (An aerial view of the rhombic is on display in the W1AW lobby.)

In Brief:

* W5V authorized: The FCC has issued Special Temporary Authority to the Albuquerque Amateur Radio Club to use the call sign W5V for its annual Veterans Day event, November 11, 1996. The station will be located at the VA Medical Center in Albuquerque. W5V will honor veterans with operations on HF and 2 meters.

* AMSAT-NA board election results: Keith Baker, KB1SF; Tom Clark, W3IWI; and Andy MacAllister, WA5ZIB all were returned to the AMSAT-NA Board of Directors. All were incumbents running for re-election. Joe Holman, KA7LDN, continues as the alternate. A total of 1645 ballots were cast.--AMSAT News Service

* SETI-Net set: Hams with an interest in the search for extraterrestrial intelligence may wish to check into the recently organized SETI-Net. The net meets Sundays at 1000 UTC on 14,204 kHz (which is exactly 1% of the popular hydrogen line radio astronomy frequency). Net control is Peter, DJ0BI. The net is sponsored by The SETI League Inc. Paul Shuch, N6TX, is the SETI League's executive director. See the group's Web site at http://www.setileague.org/ for more information.--SETI League

* New RAC QTH: Radio Amateurs of Canada (RAC) will move its administrative offices to Ottawa, Ontario, next month. The RAC administrative office will be closed for business from October 7 until October 18, for the move and while the telephone services and computer systems are transferred from Kingston to Ottawa. Starting October 18, 1996, the new RAC address will be 720 Belfast Rd, Suite 217, Ottawa, ON K1G 0Z5; tel 613-244-4367; fax 613-244-4369; e-mail rachq@king.igs.net.--Jacques d'Avignon, VE3VIA

* Picosat talk set: A talk on the Picosat system will be given at this year's AMSAT conference in Tucson, Arizona, November 8-10. The Picosat system is one view of the future of Amateur Radio satellites. It includes easy-to-use access, cellular telephone-like features and much more, contained in a network cluster of pico satellites (15 cm-per-side cubes with extendible solar panels). For more information, set your Web browser to http://www.cordis.lu/esprit/src/picosat.htm.--Peter Vekinis, KC1QF

* New satellite Web site: The Southeast Michigan Area AMSAT Net's Web site has a new page dedicated to the band plans and modes of FO-29 (JAS-2). It's part of the Web site dedicated to both analog and digital Amateur Radio satellite operation. The URL is http://www.wwnet.com/~jsmyth/index.html.--AMSAT News Service

* New AMSAT-SA head: Hans van de Groenendaal, ZS5AKV, has been elected president of South African AMSAT. He takes over from Gerald Klatzko, ZS6BTD, who has headed up AMSAT-SA for the past two years. During his tenure, ZS6BTD has been directing most of his activities toward the completion of the Phase 3D 10-meter bulletin transmitter, expected to be delivered to the integration team in the next few weeks. Klatzko will continue to serve on AMSAT-SA's committee for another year and remain responsible for the Phase 3D project. Meanwhile, the launch of SUNSAT, South Africa's first satellite carrying an Amateur Radio and experimental commercial payload has been delayed until August 1997.--AMSAT News Service

>enough does gives an account of the general trend in homebrewing.

It would if the people you listen to are representative of all
builders. But if the only places you hang out are where CW QRPers
hang out, then your POV is skewed. Try the TAPR SIGs, or try getting
on SSB and see how many stations with homebrew linears you work.

>Now, I think we're going to have to redefine "homebrewing" - I've got

>VFO. I've homebrewed VFOs before from scratch and this project won't
>begin to come close to the detailed work that those necessitated. And
>it won't be as rewarding, either.

Poor Jeffery, too hard for you to comprehend those 1s and 0s
I suppose. The fellow who designed and programmed that VFO was
homebrewing. Those who order the kit are kit builders, of course.
The act of installing a chip in a socket, or soldering a wire
to a tiepoint is home assembly. And that's what most of your
QRP CW friends do too. It's probably what you do too, since I
expect you copy your designs from somewhere rather than *really*
doing them from scratch. Mr. Colpitts or Mr. Pierce did it first,
you're just copying (or am I mistaken, is there really a Herman
oscillator circuit now?). And (gasp) you actually use factory built

parts too, instead of mining your own ores and chipping your own galena. Shame on you.

In my view, homebrew is any home contruction requiring more skill than assembling a Heathkit. Now *that* I consider just home assembly because the instructions were so detailed that someone with zero electronics knowledge could build one, and because Heath had that "we won't let you fail" guarantee. All but the most primitive builders use factory made parts. Whether those parts are tubes or ICs doesn't really matter (other than that ICs will allow you to do much more complex things than you can with discretes). And as Ramsey proves, just because it is a kit doesn't mean it isn't homebrew. By the time you debug and modify one of his kits so that it works right, you've done more than most builders who copy their circuits from the Handbook or a magazine article.

For the most part, I consider modern kit suppliers to just be acting as my purchasing agent, hunting down and gathering the parts in one package so I don't have to do it. It is convienent, but it is no different in principle than if I hunted the parts down myself for a published circuit.

Now even when I'm building something semi-original, I'm going to search out the most efficient way to build it. If that means I use a chip, I use a chip. That involves more than "snapping" an IC into a socket (which sounds like a good way to break a pin to me). You've got to install and wire the socket too, properly decoupling it in the process (no different than if you were "snapping" a tube into a socket). And you better understand what the chip wants in the way of inputs and what it supplies in the way of outputs. And you'd better understand the chip's transfer function too (again in no way different than if you were "snapping" a tube into a socket, except the transfer function is probably a lot more complex for the chip).

There aren't many really novel circuits. Most everything is an embodiment of the same basic set of building block circuit topologies. I'm not out to re-invent the wheel when I build. I'll happily rip off any circuit idea I come across that'll do something I want done in my project. It doesn't matter to me if that circuit idea is embodied in a 5 gallon bucket full of discretes or in a single chip (other factors equal, I'll choose the chip because it likely is more compact and uses less power than an equivalent discrete circuit). I'm just trying to get some functionality I can't get from commercially produced equipment, either because they don't build what I want, or because what they build costs more than I'm willing to pay.

Getting back to that DDS VFO, try duplicating its functionality using only discretes. If you can do it at all, it'd take a six

foot rack of parts to achieve a digital readout unit with frequency memories, I Hz tuning resolution, crystal stability, and the ability to hop frequency sequences in realtime for direct FSK RTTY or even SS FH use. (One of the advantages of DDS is that one frequency change is as quick as any other because there's no more settling penalty for a large excursion than a small one. You can't do that with an analog VFO at all.)

Nat,
I have a cd rom version of the Callbook and am very satisfied with it. Buckmaster doesn't even come close to matching it for quality and complete coverage. Even tho you may buy the cd rom or the printed Callbook, I wouold strongly suggest that you keep up to date on QSL managers via one of the online look-ups. Even with all of this high tech inf, I'm sorry to report that my return rate on DX QSLs is a little over 30% and worse via the bureau system. I hope you have better luck.

If you've spent a thousand plus on a pc, you can pick up some unlined
4x6 file cards. If your printer can handle the cards, print them off.
If not, get some 4x6 labels, print the QSL on the label, and stick it
on the card. Perfect fit, and your not limited to the usual stock
card the vendors sell. Scan in photos, whatever.....

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 26/2330Z SEPTEMBER 1996 BY IPS RADIO AND SPACE SERVICES
FROM THE AUSTRALIAN SPACE FORECAST CENTRE
SUMMARY FOR 26 SEPTEMBER AND FORECAST FOR 27 SEPTEMBER - 29 SEPTEMBER

1A. SOLAR SUMMARY
Activity: Very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 70/5

GOES satellite data for 25 Sep
Daily Proton Fluence >1 MeV: 2.4E+06
Daily Proton Fluence >10 MeV: 1.9E+04
Daily Electron Fluence >2 MeV: 7.1E+08 (high)
X-ray background: A2.2
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
27 Sep 28 Sep 29 Sep
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 27 Sep: 70/5

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: Unsettled to active, with minor storm
levels observed during period 18-21UT.

Estimated Indices : A K Observed A Index 25 Sep
Learmonth 19 3323 3453
Fredericksburg 18 10
Planetary 20 10

Observed Kp for 25 Sep: 1334 3212

2B. MAGNETIC FORECAST
Date Ap Conditions
27 Sep 20 Unsettled to active, with the chance of minor
storm periods.
28 Sep 15 Unsettled
29 Sep 10 Unsettled
COMMENT: A geomagnetic disturbance alert was issued at 2205 UT
on 26 September for K = 5 during the period 18 - 21 UT, 26 September.

3A. GLOBAL HF PROPAGATION SUMMARY
Latitude Band
Date Low Middle High
26 Sep Normal-fair Normal Normal-fair
PCA Event : None

3B. GLOBAL HF PROPAGATION FORECAST
Latitude Band
Date Low Middle High
27 Sep Normal-fair Normal Normal-fair
28 Sep Normal-fair Normal Normal-fair
29 Sep Normal Normal Normal

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Date T index
26 Sep 12

Observed Australian Regional MUFs:
Darwin: Enhanced up to 30% during period 01-04 UT and
greater than 30% during period 15-17UT, depressed
up to 30% for the period 04-08UT, otherwise near predicted monthly values.
Townsville, Sydney and Hobart: Near predicted monthly values.

Predicted Monthly T index for September: 9

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
Date T index MUFs
27 Sep 0 Depressed 10 to 30% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.
28 Sep 0 Depressed 10 to 30% during local day for extreme
northern and southern Australian regions, otherwise
near predicted monthly values.
29 Sep 9 near predicted monthly values

><carl@ais.net> wrote:
>>Why is the primary focus on testing ALWAYS as a means to "limit access
>>to the HF bands" ???
>
>Because, unlike V/UHF which can accomdate millions of folks due to its
>short range characteristics, if one so much as sneezes on HF he could
>possibly be heard half-way around the world.

Yeah, but not in some places in between, IE skip zones. Frequency reuse
does exist on HF too. It is not a unique characteristic of VHF. There is
a difference in that the precise coverage area isn't contiguous or as
easily mapped on HF as it is on VHF. That's a nuisance to broadcasters,
but not so much to the agile amateur operator.

>That 3.75 MHz we've been
>awarded does have an upper boundry in regard to the number of ops that
>can be accomdated.

Yes, though as FCC commissioner Susan Ness recently remarked, that
upper boundary can be made arbitrarily large by using better techniques.
And the FCC says it is no longer satisfactory to warehouse frequencies
solely so that less efficient methods can continue to be used. In 1937,
the author of _200 Meters and Down_ said that upper limit for HF was
16,000 amateurs, so we needed to raise the Morse test speed to "ration"
HF access. He would be amazed to learn how many are accomodated today,
about 460,000 US operators alone are HF authorized.

>You'll argue that if everyone used the latest fad mode we would have room
>for an unlimited number of folks; but you refuse to face the reality that
>we're not all going to shift to your mode of choice. You're guilty
>of espousing that ("you *must* use my mode") which you've condemed ("why
>*must* I learn the code?")

Not at all. Amateurs can certainly continue to *try* to use their older
modes of choice, but it will become increasingly difficult to do so.
Those who *voluntarily* choose to use superior modes will have greater
success, and eventually those who want to be successful on the bands
will follow their lead. This was the case when SSB displaced AM. AM
was not banned, but it became increasingly untenable to use while SSB
offered those who switched considerable advantage. This is just natural
selection at work. No one was coerced to switch, it just became obvious
that it would be stupid not to switch.

>One wonders why you're not chastising the SSB crowd for their wide-
>bandwidth mode - uses more than CW.

But narrower is not necessarily better (and SS is the ultimate expression of that). 120 WPM SSB has a Q of about 0.057 while 13 WPM Morse has a Q of 0.0325. So SSB uses its spectrum about twice as efficiently as CW (at the speed required for HF SSB access). Faster CW closes the gap, with 20 WPM Morse having a Q of approximately 0.05, but only a small contingent go that fast (Extra is the smallest class).

The Quality metric I'm using is WPM/Hz, of course, which measures the information passed per minute per Hertz of consumed bandwidth. For comparison, PACTOR has a Q of about 0.125 and Clover has a Q of about 0.94 (at its highest rate). Clearly, neither CW nor SSB are very good at all, though SSB holds the edge against most HF operators' real CW speed.

Now that Q is not the only metric we can apply, though it is an important one. If we didn't care about communicating information, we could all just emit unmodulated carriers. That would proclaim we exist, but wouldn't otherwise convey any useful information. We could all limit our activity to just one frequency in that case since, without the need to convey useful information, it wouldn't matter that we were just creating one howling hetrodyne.

Nor is it necessary to assume that the bandwidth consumed for the Q figure above be contiguous. If we use SS, we can spread the bandwidth across an entire band, using the little slivers which currently are unused, IE the guardbands maintained between narrowband mode operators now. With SS, those guardbands are unnecessary, and the band can be filled uniformly from edge to edge with signal. Instead of the drastic interference two narrowband operators suffer when crowded inside their guardbands, with SS, the noise floor of all operators just slightly rises with the addition of another station.

So even after the band is "full", there is still room left for more operators as long as the Eb/No doesn't get too bad. And if it does, we can have everyone reduce power, which will reduce the SS noise floor contribution, and allow even more operators on the band. There's a limit to that, however, where the signals drop below the natural noise floor. That puts a premium on techniques which work well near the natural noise floor, and guess what, modern digital technique excels there too. Strong FEC allows operation very close to the detection limit.

And there is yet one more dimension we can exploit to get more operators on the band. That dimension is time. Given a method with a high Q, we can pass the same information in a much shorter time than using modes with a low Q. That frees the channel for other users.

Now Paul will complain that users don't care about throughput. He'll say users have a certain amount of time to kill on the air, and that they want to use all of it, regardless of how much they can say in that time. There's truth to that, even

though the FCC isn't impressed by that logic anymore. But we
can fix that too. We can program our equipment to dribble
information out to us as slowly as we desire while transmitting
in quick bursts on the air. It only takes buffer memory, and
that's become very cheap. This packet-like technique still
lets us kill a lot of time operating without continously tying
up the channel and preventing other users from using it also.

Susan Ness is correct. We can accomodate arbitrarily many
amateurs on HF if we use techniques better than the ones
we use now.

THE GRAND RAPIDS AMATEUR RADIO ASSOCIATION
Presents

SUPER SWAP '96
Saturday, Sept. 28, 1996
At Unity Cristian High School in Hudsonville, MI

Seller setup at 6AM, General entry at 8AM.

Buy and sell new and used Amateur and Computer
equipment and Software. Pick up that bargain
you have been waiting for. Sell or trade that
equipment that is just laying around the shack.

Tickets are $4 in advance 5$ at the door. Tables
are $8 each. Make sure to reserve yours, they are
selling fast.

Directions: Unity Christian High School is located at
3487 Oak St. in Hudsonville, MI. From M-21 (Chicago Dr.)
Head north at 32nd Ave, Turn left to Oak St. From
I-196, use Exit 62 at 32nd Ave, Go 1.4 Miles to Oak St.
and turn left to the school.

Talk In 147.260 & 444.4 CTCSS 94.8 The W8DC Repeater

For advance tickets or table reservation contact,
GRARA, C/O SuperSwap '96, PO Box 1248,
Grand Rapids, MI 49501 or
Call Dave Devos at 616-698-7022

3847. VHF DX Opportunity

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-26 00:00:00 UTC
From: Mark Gingrich <grinch@rahul.net>
Message-ID: <52cktd$a6m@bug.rahul.net>
Source record: 216068
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.space,rec.radio.amateur.misc

On Thursday morning, 26 September, around 8:12 a.m. EDT (12:12 UTC), the Space Shuttle Atlantis (STS-79) is expected to touch down at Kennedy Space Center. About 25 minutes prior to landing, as it crosses the coast of British Columbia, the orbiter will experience sufficient atmospheric friction to create an ionized wake, a condition persisting for nearly fifteen minutes as the craft streaks like a meteor over the southern extremes of Alberta and Saskatchewan, through central North Dakota, and buzzes the cities of Minneapolis, Madison, Chicago, and Cincinnati.

DXers working VHF frequencies -- TV, FM, 2-meter, and 6-meter ham bands -- who reside within a thousand miles of all but the easternmost re-entry track will have a rare opportunity: the Shuttle-generated plasma trail may enhance reception of over-the-horizon signals, much like meteor scatter. Meteors, known to be just pea-gravel-sized flotsam colliding at high speed with Earth's atmosphere, create narrow ionized columns for a few seconds; in contrast, the near-airliner-sized Shuttle should cut a much larger plasma swath over an interval of minutes. Such temporary plasmas redirect very-high-frequency radio signals over the horizon, whereas reception usually is limited to line-of-site distances from the transmitter. Shuttle plasma effects may persist for as long as a few minutes.

DXers should tune to a known distant station in the general direction of the Shuttle's re-entry track -- that is, if you are south of the track, try for a northerly station, on an unoccupied, interference-free frequency in your area. The following Web site may assist you in finding candidate U.S. FM stations, their frequencies, and transmitter power:

http://www.airwaves.com/fmdb.html

- Re-entry Time Line -

If the re-entry goes as planned, the time line is as follows:

Event Time UTC EDT CDT MDT PDT

Arrives British Columbia 11:48 7:48 6:48 5:48 4:48

Overflies Calgary, Alberta 11:51 7:51 6:51 5:51 4:51

Overflies Fargo, ND 11:54 7:54 6:54 5:54 4:54

Overflies Chicago, IL 11:57 7:57 6:57 5:57 4:57

Overflies Cincinnati, OH 11:58 7:58 6:58 5:58 4:58

KSC Touch down 12:12 8:12 7:12 6:12 5:12

More detailed predictions (containing "look angles" at best visibility
for various locales) are available at the end of the document found at:

http://shuttle.nasa.gov/sts-79/orbit/orbiter/sighting/sighting.html

Note that only observers west of Minnesota will have a decent chance
at visually sighting the Shuttle, due to lessened interference from
sunlight/twilight. The sonic boom, however, may be detectable to
everyone in the vicinity of the re-entry track; be aware that it occurs
a few minutes *after* the Shuttle's closest approach to your location.

- Last-Minute Sources of Information -

Weather conditions at Kennedy may cause last-minute postponement of
the landing. The following Web site provides weather status:

http://www.ksc.nasa.gov/weather/weather.html

Last-minute information about the Shuttle's re-entry/landing status
is available at:

http://shuttle.nasa.gov/

Also, last-minute schedule changes are usually reported on the hourly
national news (e.g., CBS Radio affiliate stations, CNN, etc.) and on
NASA TV.

I would be especially interested in receiving successful (or even un-
successful) reports of DX catches made possible by Shuttle plasma scatter.

Good luck!

> the file tue.zip -- it was there...

Gene,

Thanks for the URL...I took a look at it myself. Looks to me like the 610V for W7AA was entered into the system on 9/20/96, clearly under the previous gate. No sign of any real volume of 1x2 or 2x1 activity in the Tuesday file by my reckoning.

I don't know how carefully the FCC has checked for eligibilty under the previous gates...I've noticed a handful of call assignments for "cool calls" that looked suspect to me, but I'm not going to get my nose out of joint for something as silly as all this. If someone is nuts enough to risk revocation of their license by making fraudulent statements on a 610V they probably spend more time in rec.fun.lobotomy than here.

Want some more goofy news? There's no official payment deadline for those who fill out the online 610V. This is beginning to take on the overtones of a good Kafka novel (or in deference to you, Ionesco (grin)).

God, I just love show business!

Waiting for Godot, or the first calls assigned under Gate 2A

Check the back of "73" or "QST" or "CQ" there are all kinds of places
that do QSL cards and there are all kinds of prices. Many print shops
also don't do well with the qso info box. Places set up to do QSL
cards do a super job and you know your getting a QSL card, not a 3x5
card that you may be embarrassed to send out.

Cross-posted to: rec.travel.air,alt.radio.scanner,rec.radio.scanner,rec.radio.shortwave,rec.radio.amateur.misc,rec.aviation.piloting

Contrary to the statement that follows....Scanners Emit very LITTLE RFI (Radio Frequency Interferance) when you compare them to the RFI emitted by computers....this computer I am working on here is VERY Noisy...I can sit the scanner next to it or near it..in the same room or in some cases, an adjacent room and hear processor noise. The processor noise varries in frequency and amplitude depending on what the processor is currently doing. Aircraft communications and beacons are AM modulated.....RFI Noise is much more of a problem on Amplitude Modulation (AM) than it is on Frequency Modulation (FM) frequencies.

I too have had security agents stop me and look at my toys..either the Shortwave. Scanner, or my newest, a Thermometer/hygrometer..or temperature/humidity pen....This gadget fits in my pocket and I frequently carry it with me!

having hi-tech toys has never really been a problem on Domestic US flights..just turn on the radio or the laptop..if the radio is in a briefcase..no one ever says anything...only hapened to me once...Why did my Sony-2010 have 2 sets of batteries....had to explain one set was for the radio and the other was for the memory, computer, and clock....

International airports, can be a different animal...they may want to sniff each device, scanner, radio, tape player, camera,,etc for nitrates..this won't get everything but it's a way of screening out commonly used or easily detectable explosives.

you can use a scanner on an aircraft without any adverse effects!!

Sound like the signes of the times to me. Anyone should realize that possession of a thing that is defined as illegal is a crime, whether or not you get caught.

Those who make the point about not getting caught, therefor not having committed a crime, are in the wrong. Eventually, they will slip up and get caught.

3859. INFO WTD: Hooking computer directly to HT

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-26 00:00:00 UTC
From: ctrown@ecst.csuchico.edu
Message-ID: <52d1mp$k4k@charnel.ecst.csuchico.edu>
Source record: 216080

I'm hoping that someone can give me some pointers. Maybe you've done something like this yourself.

I want to hook up a radio to my computer and get a digital representation of this analog signal. I'm looking to get white noise that I can then use to generate random numbers and then do some analysis on the results.

I was thinking along the lines of hooking up my HT to a A to D board to get this. Being more of a systems software engineer and not an electrical engineer, I'm not up on what I need to be aware of doing something like this.

Does anyone have any suggestions on where to look for information on this? Any experiences?

How 'bout reccomendations on 8 or 12 bit A to D cards?

Hmmm... Maybe I should think about using a good sound card connected to the Mic-out of my radio?

Thanking you in advance.

Chris...

Michael,

If you remove the wp.html off the end of the FCC URL you get a higher level folder. In it is a document called readme.txt. It has the table definitions.

Good Luck.

Granted many are sk but I doubt it is that large a percentage.

>but I'll bet that a very large percentage of the 1/5 who are no-code
>techs are still quite active ... and would like very much to get on
>"your" HF bands ... we clearly should let them ...

I bet you'd be surprised if any stats could be extracted for that.
Just in my area alone I know of many who obained their tech license
"because it was the thing to do" and now have nothing to do with
amateur radio whatsoever. There is probably no way to ever come up
with real numbers for that but I'd be willing to bet nationwide there
are quite a few -- in addition to the sk's in this category.

>>What say ye naysayers about that?
>>

>That's what "we naysayers" say ...

I hear ya. :) As far as my opinion on the code issue, it's about
60/40 in favor of keeping the code.

adell@planet.net (Steve - KF2TI) Landing, NJ writes:

>> >I bought some heavy duty paper, but dread cutting out these things.
>>
>> >Any Ideas?

I take a master sheet with two QSLs on it (made with PC drawing pkg) to Office Max and have them copy it to their heaviest colored card stock. Rotate colors so I can keep track of the "old" cards.

They have a paper cutter that I'm free to use and this will properly cut 4-5 sheets at a time. Takes a while to make a lot, but the cost comes out to a few cents a card. They have a machine cutter and with one batch they cut my cards for almost nothing extra. But it was more work than they thought and they wised up for the next batch and charged much more. So it's back to manual cutting in the future.

Can anybody recommend a source of mailing labels suitable for a laser printer and CT combination?

Regards,
Pete

writes:
: -I bought some heavy duty paper, but dread cutting out these things.

: Thats what I do. Laser (or inkjet) print 4 on a page, and use a paper
: shear to cut them up. I use a flashlight under the page to site the
: edge when I cut it. It's not too hard, and that way I can custom print
: each card (my logbook fills out the data, then I hand sign and add a
: note to each). At least it won't cost extra to reprint cards if my gate 2
: change makes it in...

As well, that's what I do. I found some 60 lb paper at Office Depot
(or was it Office Wharehouse?, or Office Express?, or Office Base?,
or Office Max? <g>) and it came in several colors. It runs thru
my HP LJIII quite well. (I do not believe the convoluted paper path in
an HP LJ4 would do it.) You DO NOT want the paper that's as heavy
as manila file folders! I make up groups of cards (2x2 on a sheet)
for specific applications (Century Club, OMISS, 2mtr mobile simplex,
6mtr SSB) -- because it's so easy.

I chop mine up with a paper cutter, too. Find a Really Big One --
it'll be soooo much easier. With a Really Big One, you can cut
2-3 sheets at a time.

Send me an sase and I'll send you a couple of samples.

>Communicator class question pool, which is under construction here in
>Finland, but the questions were rejected as too complicated :-)

The CS part works just fine if you deal with the hidden transmitter
problem, *which you should*. The easiest topology to do that is a
digital repeater for the LAN. CD will even work if the users are
duplex too, though that isn't the usual case. CD is nice, but it
isn't nearly as important as CS. And you can make CS work. Trunks
between LANs should be engineered to be non-contending, so the
problem doesn't even arise there.

>>2) It provides the leading flags needed to synchronize the HDLC clocks.
>
>>3) It provides the Txd to handle transmitter and receiver settling times.
>
>The Txd and the lack of real collision detect drastically drops the
>throughput of a channel.

Txd and flags are needed on any shared channel. There's no way to keep
the HDLC clocks of a group of stations synchronized to each other tightly
enough to not require a burst of flags at the start of a particular
station's transmission to regain synchronization at the receiving station.
And on any shared channel, transmitters have to be turned on and off in
order to allow other stations to use the channel. That implies a settling
time at key up which the protocol must allow for by delaying start of
data transmission. CD is not essential if the network properly allows
CS. The window of vulnerability to collisions is narrowed dramatically
in a properly engineered network which allows CS to work, and which

employ's the p-persist mechanism to reduce to negligible the chance
of repeated collisions in those relatively rare cases where two stations
key up at exactly the same time.

>>4) It provides a way to avoid repeated collisions through its p-persist
>> and slottime parameters.
>
>If all stations could hear each other.

If they can't, *FIX THE PROBLEM*! If you have an RF problem, fix *IT*!
Don't go off and fix something else which isn't broken. The packet
protocol is intended to allow sharing of an RF channel, but it is
not intended to compensate for poor RF path engineering.

If you have a hidden transmitter on your LAN, find the offending HT,
take it to a crossroads at midnight, and drive a wooden stake through
its black heart.

Or alternatively, if you can't rid the channel of idiots inappropriately
trying to use HTs for packet, then install a digital repeater so that
they *can* be heard by all the other stations on the LAN anyway.

This is an RF engineering issue, no different from the one voice users
face, and the proper way to solve it is the same way voice users do.
If you must run simplex, require stations to be adequate to actually
be heard by all the other stations. Otherwise, put in a repeater so that
they can be heard anyway. It's that simple.

Please demonstrate this logic and make a case for it if you believe
such a case can be made. Please explain how the FCC will be
upholding its responsibility to the U.S. citizens to prevent
interference from amateurs that build their own gear if the
amateur in question is completely incompetent with respect to
understanding how his creation works? This is the question
that neither Vince nor his buddy Leyshon can answer. The theory
examinations are *directly* related to the privileges granted and
the responsibility the FCC has to the public. The Morse Code
exams on the other hand have no such relationship.

There is no "postmark." The Mellon bank is stamping the application with
the arrival date. I mailed mine Friday, FedEx, and it got to the lockbox
supervisor at 9:30am. Not that it matters, I believe that the bank
tosses all the applications in a bag and ships them over to Gettysburg.

Then try this book: _Digital Modulation and Coding_ by Stephen Wilson.

Dr. Wilson will lead you from the crudest modulation, OOK, on up to
the more modern modulations Carl has been describing. And he covers
codes from the crude Morse to modern trellis and block codes. Quite
unique among graduate level textbooks in this field, this book takes
you from a clear and lucid theoretical analysis of information theoretic
signal spaces to the various forms of modulation and coding which implement
them, and details the various strengths and weaknesses of the techniques.
The book also includes real world examples of their application.

If you still doubt after reading this book, I can list dozens more
titles for you to pursue, starting with the classic Shannon and
ending with a dose of Vitterli's wavelets.

3879. Re: Travel with toys (electronics)

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-26 00:00:00 UTC
From: transvox@crl.com
Message-ID: <52efop$898@crl.crl.com>
Source record: 216100
Cross-posted to: rec.radio.scanner,rec.radio.shortwave,rec.radio.amateur.misc

Andy (andy@buffnet.net) had written:
| I never have had my radio toys checked, but once a CATV converter
| was checked.

I've been pretty lucky with my radio gear and tape recorders over the
years when going through airport security. The only time I have run into
a problem was when I had packed a Hallmark Keepsakes Star Trek ornament with
a talking chip in my garment bag. That was at Chicago Midway, and
the security guy opened up the box when the X-ray showed a big metal
object. When he saw what it was, he started saying "To boldly go where
no man has gone before...." in a W.C. Fields-like voice.
OK, so I guess you had to be there.

Mark

Paul,

You can find the graphics on my Amateur Radio Exam practice page at:

http://www.biochem.mcw.edu/Postdocs/Simon/radio/exam.html

along with the question pools and FCC part 97 etc. You can also take
practice exams there too.

You might want to set the preferences for your email application/browser
so that we dont see a newsgroup header like:

From: default (default)
Organization: Your Organization

that way if you have an email address we can reply directly to you,
rather than taking up the space with a post to the newsgroup. :)

Sorry, that leaves Mankind tethered to a wire. As long as Man wants
to roam free of the wire, radio won't be obsolete. It might be slower,
it might cost more, but it won't be obsolete. (Of course individual
radio techniques will become obsolete as they are superceded by better
ones, but radio won't becomes obsolete as long as the alternative is
a wire tether.)

3883. Grid Location

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-26 00:00:00 UTC
From: "David S. Bowers" <bowersda@cc.uvsc.edu>
Message-ID: <52ee0j$qnh@park.uvsc.edu>
Source record: 216104

Glancing through the January '96 QST, an article on VHF/UHF contesting gave an internet address of a grid locator program. I tried to open the location, http:/www.mit.edu:8001/geo, and could only get an error message stating the server was not found.... Does anyone know if this location has changed, closed, and/or if someone else now provides the grid location service on the internet. A netsearch only reported a personal ham page that never connected, just sat trying to contact the host for a half an hour (twice).

Any help appreciated.

>I bought some heavy duty paper, but dread cutting out these things.
>
>Any Ideas?
>
The only option I know is cheap only if you already have a computer and laser printer. If you do, you can probably buy post card size card stock (which I think are slightly larger than 3X5) from a local stationary store. I would think you could get 50 or 100 at a reasonable cost. Then print only what you need, and you can change information on the card as needed or when you want something different.

Message-ID: <52gl75$r89@solaris.cc.vt.edu>
Source record: 215906

In article <52emjt$opo@nadine.teleport.com>, prografx@teleport.com says...
>
>Also "www.qrz.com" carries the daily FCC report,

Having checked both sources mentioned in this thread, I must say it doesn't appear that the Vanity Calls are being processed very expeditiously. It is hard to tell exactly whether a "callsign change" reflects Vanity call, but there appear to be few 1X2 calls being issued, so I must conclude that few are being processed. When I asked the FCC rep at the toll free number about personnel working on Vanity calls, I was told "we have one full-time person assigned to make callsign changes." I mentioned there would probably be at least 5000 applications in Pittsburgh Monday morning. Does anyone know how the FCC will prioritize their work load? All I have heard is "date stamped, no time order", but what about their own internal handling? Also, anyone know of any source to get more information on the processed daily results than the "lantz" and QRZ feeds?

John

3886. CFV boatanchors newsgroup

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-27 00:00:00 UTC
From: res@cmprime.cis.att.com
Message-ID: <52gn31$i13@anchor.cis.att.com>
Source record: 215907

Several people have asked for details on how to vote on the proposed
new newsgroup. Since the original article has probably
expired off of most servers I am posting it here.
The voting process in going on right now, so read below for instructions
and then please vote.

Rick KT2Q

FIRST CALL FOR VOTES (of 2)
unmoderated group rec.radio.amateur.boatanchors

Newsgroups line:
rec.radio.amateur.boatanchors Vacuum tube-based amateur radio equipment.

Votes must be received by 23:59:59 UTC, 7 Oct 1996.

This vote is being conducted by a neutral third party. Questions
about this proposal should be directed to the proponent.

Proponent: Rick Stealey <rstealey@attmail.com>
Votetaker: Dave Cornejo <dave@dogwood.com>

RATIONALE: rec.radio.amateur.boatanchors

The term "Boatanchors" refers to equipment (more than 25 years old)
used by amateur radio operators ("hams"). The term is used by hams to
describe equipment which they are particularly fond of, usually for
nostalgic reasons. All over the world, in daily conversations on the
air, hams lovingly refer to old gear they are operating as their
"favorite boatanchor rig". Ususally such discussions involve
locating, restoring, collecting, and finding parts for, old ham radio
equipment. A boatanchor may have been home built, military, or once
produced by a manufacturer long since out of business. In order to
have a Usenet forum for similar discussions,
rec.radio.amateur.boatanchors is proposed.

The term "boatanchor" may not, at first, be descriptive to a person
who is not a ham. Every hobby has terms that are specific to that
particular hobby. Baseball has "dugouts", golf has a "wood", and an
"iron", and British cars have "bonnets". Within amateur radio,
working other stations at long distances could never possibly be
referred to as anything other than "DX". It has been that way for 80
years. Low power operating, likewize, is ONLY known as operating QRP.
In a similar manner, old rigs are referred to the world over by hams
as "boatanchors".

There is increasing interest in boatanchor equipment by hams. Currently boatanchor discussions are held in rec.radio.misc. A large variety of specialized topics relating to boatanchor collecting (see charter) substantiate the need for the proposed new newsgroup. During the pre-RFD discussion phase there was a substantial amount of interest in the newsgroup name (over 100 articles). During the RFD period, discussion concentrated on the charter, and topics to be included in the newsgroup. Both discussions indicate a great need for and interest in the subject newsgroup.

CHARTER: rec.radio.amateur.boatanchors

The newsgroup, rec.radio.amateur.boatanchors, is primarily for discussions of topics related to classic amateur radio gear. Participation by others who are not licensed radio amateurs are also welcome.

EQUIPMENT.
Appropriate equipment of the boatanchor category includes:
- equipment constructed primarily with vacuum tubes, not solid state devices, and manufactured generally in the post WW II-to-1970 timeframe.
- transmitters (amateur, military, home made)
- receivers (amateur, SWL, military, home made)
- station accessories (keys, bugs, microphones)
- test equipment from the boatanchor era used in the repair and restoration of boatanchors, such as scopes, af and rf generators, meters of all kinds, etc.)
- parts and techniques used in construction of boatanchors (vacuum tubes, condensers, etc.)

TOPICS.
Topics regarding the above equipment built entirely or primarily with vacuum tubes (as opposed to solid state devices) are welcomed in this newsgroup. Suitable boatanchor topics may include:
- collecting
- modifying
- tuning
- obtaining parts (specific requests for parts/equipment are permitted)
- manuals and TM (tech manuals) copies exchange
- restoration and refinishing
- values of boatanchor gear
- sources for parts
- questions and advice for others
- Morse Code operation - advice, legends and lore
- Modes of operation: CW, AM, early SSB
- manufacturing during the boatanchor era, including companies, personalities, and manufacturing techniques
- design and engineering history of equipment of the boatanchor era and comparisons to prior technology (arc- and spark-gap transmitters, Alexanderson alternators, galena detectors, magnetrons, Nixies, quartz crystals).

- other subjects of a historical nature
- commercial postings, if SPECIFICALLY offering products and services DIRECTLY relating to boatanchor collecting.

OFF CHARTER TOPICS.
The following subjects are off topic in this newsgroup:
- discussions of hi-fi, stereo, and/or broadcast receivers. (use rec.antiques.radio+phono and rec.audio.tubes newsgroups)
- antique equipment (use rec.antiques.radio+phono)
- entertainment television receivers
- cross postings from rec.radio.swap
- discussions that are more appropriately held in other rec.radio.amateur newsgroups, such as code vs no-code
- off-topic commercial postings are specifically prohibited from the newsgroup

FAQ.
- A list of Frequently Asked Questions will be developed by volunteers in the newsgroup and will be posted monthly. This FAQ will be helpful to beginers as well as first time visitors to the newsgroup. The FAQ will contain a list of commercial vendors who specialize in products and services of value to boatanchor collectors.

END CHARTER.

HOW TO VOTE

Send E-MAIL to: rrab@infobahn.net

Your e-mail message should contain one and only one of the following statements:
Your e-mail message should contain one and only one of the following statements for each of the groups:

I vote YES on rec.radio.amateur.boatanchors
I vote NO on rec.radio.amateur.boatanchors

You may also vote ABSTAIN or CANCEL; these are not counted as votes and don't affect the vote count.

Anything else will be rejected by the automatic vote counting program. The votetaker will respond to your received ballots with a personal acknowledgment by mail - if you do not receive one within several days, try again. It's your responsibility to make sure your vote is registered correctly.

If you later change your mind you may vote again from the same email address; only your last valid vote will count.

VOTING PROCEDURE NOTES:

Standard Guidelines for voting apply. One person, one vote.
Votes must be mailed directly from the voter to the votetaker.
Anonymous, forwarded or proxy votes are not valid; this includes

votes generated by WWW/HTML/CGI forms.

Vote counting is automated. Failure to follow these directions will mean that your vote does not get counted. Duplicate votes are resolved in favor of the most recent valid vote. Addresses and votes of all voters will be published in the final voting results post.

The purpose of a Usenet vote is to determine the genuine interest of persons who would read a proposed newsgroup. Soliciting votes from disinterested parties defeats this purpose. Please do not redistribute this CFV. If you must, direct people to the official CFV as posted to news.announce.newgroups. Distributing pre-marked or otherwise edited copies of this CFV will result in those votes being cancelled. When in doubt, ask the votetaker.

Common errors include quoting the entire article and sending your vote to the vote-takers personal address. Either of these two could result in your vote not being counted.

DISTRIBUTION:

This CFV has been cross-posted to:

rec.radio.amateur.misc

Pointers to the CFV will be posted in these newsgroups:

rec.radio.swap
rec.radio.amateur.equipment

We had a bunch of "cool calls" showing up on the BBS systems.
They are either originally issued calls or close family. If you have
a problem and are going to crab then at least follow it through
and make a formal accusation and force them to defend themselves.
Snide remarks and innuendo sound more like internet posts than
hams talking to hams.

John Mitchell (jbmitch@vt.edu) wrote:

: Having checked both sources mentioned in this thread, I must say it
: doesn't appear that the Vanity Calls are being processed very
: expeditiously.

I disagree, looking directly at the FCC files on their server, it
appears the turn around time on gate 1a calls was pretty quick.

: It is hard to tell exactly whether a "callsign change"
: reflects Vanity call, but there appear to be few 1X2 calls being issued,
: so I must conclude that few are being processed.

It is easy to see which applications were for vanity calls! Read the
readme.txt file and it explains how to decode the gibberish!
Most if the calls I see being replaced are from hams with "new" calls
getting 1x3 calls either from an earlier license or a deceased relative.

: prioritize their work load? All I have heard is "date stamped, no time
: order", but what about their own internal handling? Also, anyone know of
: any source to get more information on the processed daily results than
: the "lantz" and QRZ feeds?

By now we've heard that the FCC will not issue any gate 2 calls until
they are sure Mellon bank has forwarded all first-day applications to
the FCC. Then the FCC will put them all in the computer and the
computer will start sellecting applications at random and assign calls!
That's a LOT of typing for the clerk to do, entering 25 choices out of
4-5 thousand applications! I expect a L O N G wait!

But it sure is exciting! :-)

>>>Wow. 200 miles. That's DEEEE-X. Imagine what you could do with a real radio
>>>and a fourty meter dipole........

Obviously apples and, er... doughnuts. Ferty meters ain't nothin' like two.

What's more interesting though, is that flatlanders seem to have a better
chance to work long distance VHF than us mountain hillbillys.
Up here in Orygun we got lots of repeaters on top of 4000 foot mountains and
even a few up about 7000 feet. Still, you can't go more than 100 miles or
so on your handheld because after those mountains are more mountains, and
more mountains...
My farthest repeater contact was made from Bristol, Virginia to Columbus, Ohio
via a repeater up in the Smokey Mountains. This was a distance of about
300 miles and without favorable propagation conditions. I used a Yaesu FT-07
which was the first microprocessor controlled handheld and had new features
like scanning. Back in 1981.

Another place to go the distance on repeaters is the Hawaiian Islands.

I would conclude from the above that people would choose to learn and use CW even if a CW test were not required. So the above is an argument for removing the CW test since people would flock to such an effective means of communication anyway. If CW is truly attractive and effective then there is no reason to use the threat of force from the feds to try to give CW an artificial advantage over the other modes.

I would learn CW and use it even if it were not a requirement.
I assume this is true of all pro-coders and even true of the pro-code-testers. I just wonder if the pro-code-testers feel, really deep down, that CW is inferior, not attractive, and not effective and would disappear without government subsidy. Is it protected because it is a useful mode or is it simply another endangered species?

Ever hear of PL TONES, Chris? It just so happens that on the repeaters I was accessing, the co-channel repeaters all had DIFFERENT TONES on them. That's right, Chris...when you set the PL tone on your radio, you only bring up the machine with that tone on it, regardless of how many other co-channel repeaters you may be able to hit.

Better get out your owners manual and brush up on that section about PL TONES, Chris.

From: VUBS79A@prodigy.com
Message-ID: <52gvr9$1rri@usenetw1.news.prodigy.com>
Source record: 215918

This is really something...

I've been getting nasty E-Mail and posts on here for months now about how I supposively don't post anything positive or of value to amateur radio. While I don't agree with this (IMO, the code vs no-code debate is one of the most important issues in ham radio today), I decided to post something "positive", non-argumentive, and useful with regards to ham radio.

I posted a notice of the good 2m band conditions down here in Florida and my experiences making contacts during the band opening.

What did I get in return? Just a bunch of crap and sarcastic garbage from the usual bozos on here. Hey, I tried...and all I got was a bunch of crap for my trouble.

So, I guess I'll go back to the way I was before. Let the code wars and flame wars begin (again!)

LAST CALL FOR VOTES (of 2)
unmoderated group rec.radio.amateur.boatanchors

Newsgroups line:
rec.radio.amateur.boatanchors Vacuum tube-based amateur radio equipment.

Votes must be received by 23:59:59 UTC, 7 Oct 1996.

This vote is being conducted by a neutral third party. Questions
about this proposal should be directed to the proponent.

Proponent: Rick Stealey <rstealey@attmail.com>
Votetaker: Dave Cornejo <dave@dogwood.com>

RATIONALE: rec.radio.amateur.boatanchors

The term "Boatanchors" refers to equipment (more than 25 years old)
used by amateur radio operators ("hams"). The term is used by hams to
describe equipment which they are particularly fond of, usually for
nostalgic reasons. All over the world, in daily conversations on the
air, hams lovingly refer to old gear they are operating as their
"favorite boatanchor rig". Ususally such discussions involve
locating, restoring, collecting, and finding parts for, old ham radio
equipment. A boatanchor may have been home built, military, or once
produced by a manufacturer long since out of business. In order to
have a Usenet forum for similar discussions,
rec.radio.amateur.boatanchors is proposed.

The term "boatanchor" may not, at first, be descriptive to a person
who is not a ham. Every hobby has terms that are specific to that
particular hobby. Baseball has "dugouts", golf has a "wood", and an
"iron", and British cars have "bonnets". Within amateur radio,
working other stations at long distances could never possibly be
referred to as anything other than "DX". It has been that way for 80
years. Low power operating, likewize, is ONLY known as operating QRP.
In a similar manner, old rigs are referred to the world over by hams
as "boatanchors".

There is increasing interest in boatanchor equipment by hams.
Currently boatanchor discussions are held in rec.radio.misc. A large
variety of specialized topics relating to boatanchor collecting (see
charter) substantiate the need for the proposed new newsgroup. During
the pre-RFD discussion phase there was a substantial amount of
interest in the newsgroup name (over 100 articles). During the RFD
period, discussion concentrated on the charter, and topics to be
included in the newsgroup. Both discussions indicate a great need for

and interest in the subject newsgroup.

CHARTER: rec.radio.amateur.boatanchors

The newsgroup, rec.radio.amateur.boatanchors, is primarily for discussions of topics related to classic amateur radio gear. Participation by others who are not licensed radio amateurs are also welcome.

EQUIPMENT.
Appropriate equipment of the boatanchor category includes:
- equipment constructed primarily with vacuum tubes, not solid state devices, and manufactured generally in the post WW II-to-1970 timeframe.
- transmitters (amateur, military, home made)
- receivers (amateur, SWL, military, home made)
- station accessories (keys, bugs, microphones)
- test equipment from the boatanchor era used in the repair and restoration of boatanchors, such as scopes, af and rf generators, meters of all kinds, etc.)
- parts and techniques used in construction of boatanchors (vacuum tubes, condensers, etc.)

TOPICS.
Topics regarding the above equipment built entirely or primarily with vacuum tubes (as opposed to solid state devices) are welcomed in this newsgroup. Suitable boatanchor topics may include:
- collecting
- modifying
- tuning
- obtaining parts (specific requests for parts/equipment are permitted)
- manuals and TM (tech manuals) copies exchange
- restoration and refinishing
- values of boatanchor gear
- sources for parts
- questions and advice for others
- Morse Code operation - advice, legends and lore
- Modes of operation: CW, AM, early SSB
- manufacturing during the boatanchor era, including companies, personalities, and manufacturing techniques
- design and engineering history of equipment of the boatanchor era and comparisons to prior technology (arc- and spark-gap transmitters, Alexanderson alternators, galena detectors, magnetrons, Nixies, quartz crystals).
- other subjects of a historical nature
- commercial postings, if SPECIFICALLY offering products and services DIRECTLY relating to boatanchor collecting.

OFF CHARTER TOPICS.
The following subjects are off topic in this newsgroup:
- discussions of hi-fi, stereo, and/or broadcast receivers. (use rec.antiques.radio+phono and rec.audio.tubes newsgroups)

- antique equipment (use rec.antiques.radio+phono)
- entertainment television receivers
- cross postings from rec.radio.swap
- discussions that are more appropriately held in other rec.radio.amateur newsgroups, such as code vs no-code
- off-topic commercial postings are specifically prohibited from the newsgroup

FAQ.
- A list of Frequently Asked Questions will be developed by volunteers in the newsgroup and will be posted monthly. This FAQ will be helpful to beginers as well as first time visitors to the newsgroup. The FAQ will contain a list of commercial vendors who specialize in products and services of value to boatanchor collectors.

END CHARTER.

HOW TO VOTE

Send E-MAIL to: rrab@infobahn.net

Your e-mail message should contain one and only one of the following statements:
Your e-mail message should contain one and only one of the following statements for each of the groups:

I vote YES on rec.radio.amateur.boatanchors
I vote NO on rec.radio.amateur.boatanchors

You may also vote ABSTAIN or CANCEL; these are not counted as votes and don't affect the vote count.

Anything else will be rejected by the automatic vote counting program. The votetaker will respond to your received ballots with a personal acknowledgment by mail - if you do not receive one within several days, try again. It's your responsibility to make sure your vote is registered correctly.

If you later change your mind you may vote again from the same email address; only your last valid vote will count.

VOTING PROCEDURE NOTES:

Standard Guidelines for voting apply. One person, one vote.
Votes must be mailed directly from the voter to the votetaker.
Anonymous, forwarded or proxy votes are not valid; this includes votes generated by WWW/HTML/CGI forms.

Vote counting is automated. Failure to follow these directions will mean that your vote does not get counted. Duplicate votes are resolved in favor of the most recent valid vote. Addresses and votes of all voters will be published in the final voting results post.

The purpose of a Usenet vote is to determine the genuine interest of persons who would read a proposed newsgroup. Soliciting votes from disinterested parties defeats this purpose. Please do not redistribute this CFV. If you must, direct people to the official CFV as posted to news.announce.newgroups. Distributing pre-marked or otherwise edited copies of this CFV will result in those votes being cancelled. When in doubt, ask the votetaker.

Common errors include quoting the entire article and sending your vote to the vote-takers personal address. Either of these two could result in your vote not being counted.

DISTRIBUTION:

This CFV has been cross-posted to:

rec.radio.amateur.misc

Pointers to the CFV will be posted in these newsgroups:

rec.radio.swap
rec.radio.amateur.equipment

It is true, this was the first of Drew's posts where he actually seemed to be enjoying ham radio, and I salute him for it. I guess the only explanation for the negative reactions was that he took some people by surprise, kind of like when somebody shaves off the beard they've had for 20 years...

> Buckmaster and QRZ. I'm considering buying a callbook (or CD ROM
> version) if it provides better coverage. Do any of you have suggestions
> or opinions on which callbook would be a good purchase?

The Radio Amateur Callbook on CD includes the North American and the
International Listings. If you want DX addresses, I haven't seen
anything to touch it. But for those that want only North American
Listings, I find the SAM CD far superior. SAM's Browse mode which
can be keyed on both Name and on Call gives a screen full of adjacent
listings and is brilliant. The RAC Browse is much less useful because
it only throws up one call at a time in Browse mode and this makes it
much harder to match say family members or close addresses.

I recently picked up a used YAESU FT-747GX that has the PC interface on it.
So I am searching the 'Net' for programs that make use of this interface.
YAESU calls it the Computer Aided Transceiver interface.
Anybody know of a site where I can FTP a sample program.
I am planning on using Borland "C" to write an interface when I get time,
but I like to see samples.
I don't need to use this PC interface, but it might be fun to
play with.

Gene's not far wrong. I seem to recall having heard of a situation
that came to light here in the US in the 60's where people in the FCC
were getting "cool" calls out of sequence. But it could be just
rumor.

It wouldnt be so bad, but your posts are full of attacks, asumptions, childish name-calling, insults, and lies.

That is NOT debating drew.

>I decided to post
>something "positive", non-argumentive, and useful with regards to ham
>radio.

It is true that you have never done this before.

>I posted a notice of the good 2m band conditions down here in Florida and
>my experiences making contacts during the band opening.

You mean "repeater" contacts...which is considered bad practice.

>What did I get in return? Just a bunch of crap and sarcastic garbage
>from the usual bozos on here.

Yea...the exact SAME THING we been listening from you since the day you were licensed.

>Hey, I tried...and all I got was a bunch
>of crap for my trouble.

My Dad used to say, "You made your bed...now you have to sleep in it."

>So, I guess I'll go back to the way I was before.

No suprise here...like you REALLY were going to change...yea...right.

>Let the code wars and
>flame wars begin (again!)

There is no war...you currently have to pass a morse code test to gain access to the amatuer HF bands...PERIOD.

Take care drew. :)

3907. US License Examination Opportunities Scheduled 9/27/96 to 12/31/96

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-27 00:00:00 UTC
From: "Bart Jahnke, KB9NM ARRL/VEC" <vec@arrl.org>
Message-ID: <324C33B4.2286@arrl.org>
Source record: 215928

This page was last revised September 27, 1996.

You can Email the ARRL/VEC (or this page's content
administrator) at "vec@arrl.org".

*****>> When viewing this list, if the list appears to be cut
off (stops somewhere in the middle of the state's listings)
try downloading the entire file then viewing it off line.
Some WEB browser programs have exhibited this problem.

****

Have you recently passed your test? Find out your new call sign and/or
license privileges using the following World Wide Web URL (or by using
the phone number shown below):

http://www.ualr.edu/~hamradio/

or look for this link from the ARRL WEB page at

http://www.arrl.org/

At ten (10 days) after the test session call 860-594-0300.

****

AMATEUR RADIO EXAMINATION OPPORTUNITIES

****

Want to find out what if your new FCC license has been granted?
Has it been 10 days since you took you examination?

If so, Call ARRL at 1-860-594-0300 (8 am to 9 pm weekdays, eastern time)
to find out. We suggest that you not call the FCC (should you choose to
call the FCC at 1-800-322-1117 during business hours, be aware that their
number is normally busy).

Your hardcopy (printed) license would follow shortly after the license
grant is indicated in the FCC Amateur Service data base.

If your test was coordinated through the ARRL/VEC, license turnaround
time will be approximately 7-15 days. This includes 1-5 days for the
VE team to complete their processing (the team has up to 10 days before
they must mail the results), 3-5 days between the VE team and the VEC;
2 business days at the VEC (in some cases only 1 day); and 1-3 business
days at the FCC. Allow 5 business days from the date that the VE team
estimates the test session results will reach the VEC.

****

NEED AN FCC FORM 610?

The ARRL/VEC can supply you with your needed Forms 610, whether they be for the Reciprocal Permit for Alien Amateur Licensee, Form 610-A; Club/Military-Recreation/RACES station, Form 610-B; or Form 610 for Amateur Operator/Primary Station License. FCC Form 610-R is a computer generated renewal form that will be sent from the FCC (beginning September 1995) to licensees whose license is to expire within 90 days. Form 610-V is the special application for persons seeking a Vanity call sign (see below).

Several FCC forms, including Form 610, are available through the FCC's fax-on-demand service by calling 202-418-0177 (request form "000610" for Form 610, form "006108" for Form 610V).

You can obtain FCC Form 610V along with FCC form 1070V and FCC vanity call sign information fact sheet PR 5000, number 206v) by writing ARRL, 225 Main Street, Newington, CT 06111. You must include an SASE.

Form 610 or other forms, including Form 610V, are also available from the FCC via the internet at:

http://www.fcc.gov/Forms/

or

ftp://ftp.fcc.gov/pub/Forms/

The FCC Forms Distribution Center will accept FCC forms requests by calling 800-418-3676.

****
VANITY CALL SIGNS - SUBMITTING YOUR APPLICATION VIA THE WORLD WIDE WEB

Vanity Call Signs can also be applied for, in the appropriate eligibility Gate, at the appropriate time, by using the following URL:

http://www.fcc.gov/wtb/amradsrv.html

****

STILL NEED TO PREPARE FOR YOUR EXAM?

If you would like information on how to become licensed; or how to locate Amateur Radio clubs, instructors, licensing classes and/or Novice examiners in your area; please contact the ARRL Educational Activities Department (EAD) at 860-594-0301. The EAD can also provide information on recommended study materials. Electronic mail may be forwarded to the ARRL EAD via USENET at "ead@arrl.org" or via MCI Mail to MCI ID: 215-5052.

****

THINGS TO BRING TO EXAMINATIONS

Bring a photo ID along with a second form of identification (else bring two non-photo forms of ID); bring your original FCC license and a photocopy of your license (if you are currently licensed); bring the original and a copy of any Certificate(s) of Successful Completion of Examination (CSCEs); if necessary, bring a scientific calculator (that does not have the ability to store formulas); bring a pen and two pencils; and be sure to bring payment for the test fee if charged by the VEC.

****

EXAMINATION CREDIT IS AVAILABLE AS FOLLOWS

By presenting an original, current FCC-license, the following exam credit will be conveyed to the applicant by the VE Team:

Novice - Elements 1A and 2
Technician (dated after 2/14/91) - Elements 2 and 3A
(*)Technician (dated before 3/21/87) - Elements 1A, 2, 3A and 3B
Technician Plus - Elements 1A, 2 and 3A
General - Elements 1B, 2, 3A and 3B
Advanced - Elements 1B, 2, 3A, 3B and 4A
Extra - All elements

Footnote:

(*) For grandfather Element 3B credit, only an original license or a copy which was issued on or before 3/21/87 is acceptable by VEs. VECs may be able to allow such credit based upon an original CSCE issued on before that date which shows Element 3 credit for passing the (then) 50 question Technician/General written test. If such documentation has been destroyed, the FCC will itself issue the necessary verification. To obtain such verification, acceptable by all VE Teams and VECs, write to FCC and request a "Letter of Verification of Technician License Held Prior To March 21, 1987". Mail (or fax 717-337-1541) your request to: FCC, 1270 Fairfield Rd, Gettysburg PA 17325-7245. If you include reference to a fax number in your reply, the FCC will fax your verification letter to you. Normal turnaround at FCC is 3-5 business days after receipt.

By presenting an original Certificate of Successful Completion of Examination (CSCE), the following credit is conveyed:

* For Technician licensees: A CSCE showing Element 1A, 1B or 1C credit qualifies the holder for Technician Plus HF privileges. The CSCE may have been issued more than 365 days earlier.

* For others: A CSCE issued up to 365 days earlier conveys credit for the element(s) shown as passed. A Physician's Certification on a Form 610 is acceptable by a VE Team for 365 days after the Physician's signature date. Once accepted by the VE Team, assuming the applicant qualifies for a General or Advanced license,

a CSCE is issued showing Element 1C (or "Physician's Cert. and Release: 1C") credit is valid for 365 days toward an Extra class license.

****

LOST LICENSES

If you have lost your license, you can obtain a duplicate by writing to: FCC, 1270 Fairfield Rd, Gettysburg PA 17325-7245; indicating that you lost your license and that you are requesting that a replacement license be issued to you. You may fax your request to FCC at 717-337-1541.

****

ACCOMMODATIONS FOR THE HANDICAPPED OR DISABLED

The FCC requires that the administering VEs must accommodate an examinee whose physical disabilities require a special examination procedure. To do so, the administering VEs may require a physician's statement indicating the nature of the disability before determining which, if any, special accommodative procedures must be used.

The VEs may accommodate handicapped/disabled examinees by administering the examination at a place convenient and comfortable for the examinee--even at bedside; for the hearing impaired the Morse code may be sent using flashing lights or a vibrating surface; for the visually impaired, VEs may read or write for the examinee; where warranted, the VEs may pause the Morse code message after each sentence/phrase, or each word, or even after each character to allow the examinee additional time to absorb and interpret what was sent--also the VEs may substitute a sending test for a receiving test where the examinee's handicap warrants.

VE Teams may need advanced notice in order to provide the necessary accommodations to examinees who require them. If you will require accommodations, please contact the VE Team in advance to advise them of your needs.

EXEMPTION OF THE 13/20 WPM MORSE CODE REQUIREMENTS

If you are a severely handicapped or disabled individual and have already passed at least a 5 WPM Morse code examination (or hold a license which meets that requirement), you may be eligible for exemption from the 13/20 WPM Morse code examination requirements. See the back of a current FCC Form 610 for details.

****

The following test session information is provided by the ARRL/VEC for the upcoming eight to twelve week period. For further information, please contact the test session CONTACT PERSON at the telephone number provided. If necessary, you may contact the ARRL/VEC at 860-594-0300 for additional information. Electronic mail may be forwarded to the ARRL/VEC via USENET at "vec@arrl.org" or via MCI Mail to MCI ID: 215-5052.

Although the test session information presented here does not indicate whether walk-ins are accepted or not, most test sessions do allow walk-ins. We encourage you, however, to always contact the CONTACT PERSON at the telephone number provided so that the VE Team is aware that you be attending the test session.

EXAM LISTINGS - DEFINITION OF FIELDS

STATE
Test Date,VEC,City,Zip-code,Contact Phone,Contact Person

The SECOND field in the following listing specifies the VEC which is coordinating this examination. This single-character designator denotes the VEC as defined below. An "A" (for example) indicates that this examination is coordinated by the ARRL/VEC.

3908. Wow, Gate 2: 4500+, Day 1

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-27 00:00:00 UTC
From: Jim Reid <jreid@aloha.net>
Message-ID: <01bbaca3$267e9fe0$89070ccf@jim-reid-1>
Source record: 215929
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy

Appears interest in amateur radio is very high as nearly
10% of US Extra license holders submit Vanity Call
sign requests the first day the opportunity is open!

Many of these guys are CW fanatics and are avid contest]
operators. Many of the "new" calls being sought are thought
to be real great CW calls: rythmic, easy to copy at QRQ,
close to the call already owned by some Big Gun famous
operator, etc. Interesting thread on cq-contest reflector for
past few weeks about what constitutes a desirable contest
call for either CW or SSB. Many felt a five character call was
better than 4 characters; also that a 2x1 was too short, etc.

Well the evidence will be in when, in a few weeks the FCC
computer spits out all the winning calls. Then will be easy to
see who got what, and what kind of call really does seem
most popular for band conditions on high density HF band
signal weekends, and in pile-ups seeking the attention of
the DX station. What will the kind of call be that the majority
of the contestors go for? I picked, as my first 5 choices all
KH7x, or 2x1 calls. Why? I always wanted one! Not
anything at all to do with ease of copy, but believe the
one I hope to get among the group will be easy to copy on
a dense band and/or in a pile-up.

Good luck to all on your pick. With probably more than 5000
Extras applying this week alone, there must be many who will
be reading this.

73 and Aloha, Jim, for now AH6NB, next KH7? or ??

ARRL Bulletin 67 ARLB067
From ARRL Headquarters
Newington CT September 27, 1996
To all radio amateurs

SB QST ARL ARLB067
ARLB067 MARS to drop all CW nets

All CW nets and other CW activity in the Military Affiliate Radio
System (MARS) have been ordered to cease operation effective October
1, 1996. After that time, no CW nets or other CW activity will be
allowed on any DOD MARS frequencies. A final MARS CW message will be
transmitted simultaneously on Army, Navy and Air Force MARS
frequencies at 1300, 1530 and 1700 UTC on September 30. MARS members
may earn a certificate for correct copy of the final message.

I am not a "fanatic" about diesel, but like most commerical prime
nover users, I do recognize that diesel has a number of important
advantages. At the man-portable generator level, gasoline engines
hold a weight advantage, and we use a number of them (mostly Honda),
but if lowest weight isn't a factor, such as with trailer mounted
or fixed mounted generators, diesel engines have advantages.

Your concerns about fuel availability and maintenance simply
reflect a lack of experience with diesel. Fuel is widely
available, both from primary and alternative sources, and
routine maintenance is generally simpler for diesel than for
gasoline powered equipment. Operating economy is better too.
If this were not so, there wouldn't be such wide commercial
use of diesel prime movers. Capital costs can be higher, but
life cycle costs are markedly lower, more than offsetting the
difference in initial investment.

Our broadcast group operates 92 generator equipped vehicles.
Our satellite trucks and heavy production vans use diesel
generators (with the production vans' generators mounted on
tow behind trailers). Our light vans use gasoline generators
(mainly so they can run off the vehicle's fuel tank, thus avoiding
trying to fit a second tank into an already cramped vehicle).
And, no surprise, it is the gasoline generators which give the
most trouble and require the most maintenance attention. In fact,
we've only had one diesel generator failure in the last 5 years,
but we have failures with one or more of the gasoline generators
at least once a month.

I don't want to give the impression that gasoline powered
generators are junk. All these generators see heavy service,
often required to run several times daily under all sorts of
conditions. And most of the failures are ignition or carburetor
related, and can often be solved in the field. But the diesels
have neither ignition systems nor carburetors which can fail.

The one diesel failure was due to a failed fuel cutoff solenoid, and that was overridden by hand in the field.

Being in TV news use, these vehicles spend a good amount of time in disaster areas, particularly the satellite trucks. They routinely chase hurricanes, go to the site of tornado damage, aircraft crashes, etc. We generally feel more comfortable when we have a diesel generator powered vehicle on scene becuase we have a greater expectation that it will work when needed. That's particularly true in the wet conditions of hurricanes. That often drowns out gasoline engines, but because the diesels have no ignition system, they are much less affected by water spray (you literally have to drown their air intakes to kill them).

We also operate 24 fixed generators for backup service. They are all diesel. This is more typical emergency backup service in that the generators must always be fueled and ready to go, but aren't run very often or very long. The big advantage diesel offers with its stable fuel is critical here. We typically have 1,000 or 1,500 gallons of fuel on premises for these backup units (that'll run them for about 3 days, we've only had one outage lasting longer than that which required us to get a tanker truck on scene). If we had to recycle that fuel every few months, it would be cost prohibitive (our total fuel is about 30,000 gallons stored at 24 sites). With diesel, we can annually add makeup fuel to take care of the fuel we consume doing monthly tests, and leave the bulk of the fuel in the tanks ready for an actual outage.

While some of our generator usage is much more heavy duty than hams would normally require, I think our experience is useful. Our light vans use 5 kW Onan RV generators typical of what hams might consider. Our Satellite trucks use 15 kW diesel generators and our production vans pull 25 kW diesel generators (TV lights are power hogs). This might be typical of what a club disaster response unit might want to have (and in fact is typical of what some ham clubs do have, thanks to this size unit being surplused by military communications units and given to Civil Defense associated clubs). Our big 500 kW fixed generators are almost certainly larger than any ham group would field, but the lesson of always fueled and ready shouldn't be lost on those who need to respond immediately to emergency conditions.

At my farm, I chose to go a slightly different way. I have a 15 kW PTO driven generator (from WW Grainger) that can be powered by one of my tractors. That way I don't tie up a prime mover for backup uses only. It isn't instantly available, but I can have it hooked up and running in a few minutes. While this generator can be powered by my little gasoline engined Ford tractor, I'd normally hook it up to one of the bigger diesel tractors. That's because diesel engines are more economical to run over their entire useful load range than gasoline engines.

At light loads, they only inject enough fuel to maintain RPM, but a gasoline engine must always use enough fuel to maintain a 14:1 air:fuel ratio or it will misfire or detonate. Thus it runs with best economy only when loaded to about 80% of wide open throttle, and when operated near its torque peak RPM (same thing really). Diesels don't have throttles, controlling their speed solely by the amount of fuel injected into the engine. Typically that allows them to be about twice as fuel efficient as gasoline engines. (That's important in a disaster situation where fuel resupply may be a concern.)

Gasoline engines have retained favor for auto use because they are more "lively" to drive. The combination of lower engine weight for a given peak horsepower and rapid throttle response make them more fun to drive. I've owned and driven both, and while the diesel is more efficient, the gas powered buggies are more fun (and perhaps safer in situations where quick throttle response is important). That doesn't apply to "driving" a generator though.

>Oh yeah: AM, FM, SSB, RTTY and AMTOR are nice too.

Sure, Monty, all those methods can be amusing to use, even CW,
if you like that sort of thing. That says nothing one way or
the other about whether a speed test in any of those modes
satisfies any legitimate government licensing concern. Nor
does it address the relative utility of the various methods
in any objective sense.

Morse is a text transmission mode, as are the more modern methods.
Any of them can be used with standard abbreviations to establish a
minimal level of communications. The advantage of other methods is
that they can do much more if a common language does exist between
the persons involved in the communications exchange. That's because
they offer better throughput and can often operate under more severe
conditions. Most any transmitter can be adapted to use them with
minimal effort, even WWII vintage equipment.

In essence, the tradeoff is between hardware programming and
wetware programming. The latter is almost always more costly
in man-hours than the former.

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 27/2330Z SEPTEMBER 1996 BY IPS RADIO AND SPACE SERVICES
FROM THE AUSTRALIAN SPACE FORECAST CENTRE
SUMMARY FOR 27 SEPTEMBER AND FORECAST FOR 28 SEPTEMBER - 30 SEPTEMBER

1A. SOLAR SUMMARY
Activity: Very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 70/5

GOES satellite data for 26 Sep
Daily Proton Fluence >1 MeV: 2.6E+06
Daily Proton Fluence >10 MeV: 1.8E+04
Daily Electron Fluence >2 MeV: 2.0E+08 (moderate)
X-ray background: A2.2
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
28 Sep 29 Sep 30 Sep
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 28 Sep: 70/5

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: quiet to unsettled, with one active period.

Estimated Indices : A K Observed A Index 26 Sep
Learmonth 11 3224 3222
Fredericksburg 17 24
Planetary 15 23

Observed Kp for 26 Sep: 3443 3354

2B. MAGNETIC FORECAST
Date Ap Conditions
28 Sep 15 Unsettled to active
29 Sep 15 Unsettled to active
30 Sep 15 Unsettled to active
COMMENT: Isolated active periods expected for next three days,
especially during local night hours.

3A. GLOBAL HF PROPAGATION SUMMARY

Latitude Band
Date Low Middle High
27 Sep Normal Fair Fair
PCA Event : None

3B. GLOBAL HF PROPAGATION FORECAST
Latitude Band
Date Low Middle High
28 Sep Normal Normal-fair Fair
29 Sep Normal Normal-fair Fair
30 Sep Normal Normal-fair Fair
COMMENT: HF conditions at high latitudes are expected to remain
slightly degraded over next three days, with conditions slowly
improving.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Date T index
27 Sep -11

Observed Australian Regional MUFs:
Darwin: depressed 15%, near predicted monthly values
after dawn this morning.
Townsville: depress 15% during local day, recovering
during local night hours.
Sydney: depressed 15-30% during local daylight hours.
Hobart: depressed 30% during local daylight hours.

Predicted Monthly T index for September: 9

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
Date T index MUFs
28 Sep 5 near predicted monthly values
29 Sep 5 near predicted monthly values
30 Sep 5 near predicted monthly values
COMMENT: Degraded HF comms may have been experienced on 27 September,
especially in the southern region (mid to high latitudes) with
a general mild depression observed at most sites. This is probably
associated with recent geomagnetic activity. Mid to high latitude
HF comms may be degraded over the next 3 days, as mild geomagnetic
declines.

Uh, Steve...what problem? I believe I clearly indicated that I don't really
care one way or another.
Good God! It's only radio...chill out, OM.

> Snide remarks and innuendo sound more like internet posts than
> hams talking to hams.

Sorry, old chap...much of the traffic on 80m and many 2m repeaters makes
even the most witless Internet flames seem like a Rhodes Scholars debate.

Since you seem to be well versed in ethics, let me relate a recent
experience to you. I'm interested in your opinion and feel that it's about
time that we introduce some major subject drift into this thread (grin).

I've been a VE for some time (both W5YI and ARRL) and (unlike the whole
vanity call debacle) take that job rather seriously.

I recently VE'd at a session and was presented with a 610 with the
Physician's waiver section on the back filled in and signed by a Doctor of
Osteopathy. The party in question was a tech plus and was taking the
General written exam. Several of us were well aquainted with the fellow, a
pleasant enough person, who has exhibited nary a trace of any sort of
disability in the four years we have known him. I called the other VEs out
of the room to discuss the matter. We all knew that the applicant had never
attempted the 13 or 20 wpm tests. A few of the other VEs said that it was
not our place to call the physician's certification into question. That,
they claimed, was the business of the VEC and FCC. They were not even
willing to ask the fellow what the nature of his disability is. The group
decided to pass the paperwork on, with myself as the lone dissenter. Since
we had a half-dozen VEs at the session I was afforded the luxury of
refusing to sign the CSCE or 610.

What would you have done? Was I being too up tight?

From Tad Cook, KT7H
Seattle, WA September 27, 1996
To all radio amateurs

SB PROP ARL ARLP040
ARLP040 Propagation de KT7H

Solar activity remains low, and in fact there were no visible sunspots over the past week. Average sunspot number is zero this week, down from 1.6 of last week. Solar flux was actually up slightly, from 67.8 to 69.6. Every day the solar flux was lower than the 71 average for the previous 90 days.

Geomagnetic conditions were active over the past two weeks. It was the worst on September 20, when the A index was 37 and the K index was five for half of the day.

Geomagnetic disturbances are expected to slack off through the end of the month, and the A index should be below 10 from October 2 to 6. Solar flux should remain flat near 70 until the end of the month, then dip down slightly until mid October, Look for recurring disturbances around October 7 to 8, although it should not be as bad as it was over the past two weeks.

Sunspot Numbers for September 19 through 25 were 0, 0, 0, 0, 0, 0 and 0, with a mean of 0. 10.7 cm flux was 69.2, 69.2, 69.8, 68.6, 69.9, 70 and 70.8, with a mean of 69.6.

Dear Mr. Morse,

Nice to meet you. I thought you were dead. I like your suggestion, but nowadays there are a too many signals being transmitted for such a receiver to operate with adequate selectivity. But your right, they worked pretty good back in your day.

Best Regards,
Jim AC6XG

ps. they changed the heck out of your code

Be aware that the noise distribution you get out of a radio won't be white noise. It will be colored by the filtering in the radio. This may or may not matter for your application, but if you really need random numbers, this isn't a good way to get them.

This is a very good idea. The FAA has no sense of humor at all about this issue. But some general comments might be in order (see below).

>In <52cg4r$8ao@hptemp1.cc.umr.edu> sidener@halley.cc.umr.edu (Scott
>Sidener) writes:
>>
>>Hi, I am about to put up a 100 foot freestanding tower on my
>property.
>>
>>There currently is a commercial tower the same hight only 1 mile from
>>where I live and it has red flashing lights half way up and on top.

This may be a clue that you're close to an airport, heliport, or restricted airspace. Normally, you don't need to mark a tower with a height of less than 200 feet, but you do in certain cases. Part 97.15 covers this in general terms. There are particular cases where FAA requirements may be more stringent.

>>First, I was wondering what the different light configurations on towers
>>mean? Sometimes you see red lights (solid or blinking) or white lights
>>(solid or blinking) sometimes all of the lights on a tower are the same
>>color and sometimes they alternate. Sometimes the towers are painted red
>>and white and other times they are not.
>>
>>Can anyone give me the rhyme or reason for this?

Changing requirements and grandfathering of existing structures. The FAA requirements have changed several times over the years, but existing towers are generally grandfathered when such changes take place. Therefore you can see several different sorts of marking schemes in use.

Most new towers will use strobes. Those are the bright flashing white lights. These towers do not need to use the alternating paint scheme, but the strobes must operate both day and night. For towers which only show lights at night, the alternating paint scheme is still required (and it isn't exactly red, the FAA regulations specify the paint color to be used).

The solid color lights are called obstruction "marker" lights.
The blinking lights are called "beacon" lights. Depending on
tower height, a combination of these two types of lights may
be required. The top light must generally be a beacon (there
may be exceptions to this, but I don't recall seeing a tower
with a marker top light).

At one time, every tower in an area was assigned a particular
flash pattern to make it easily identifiable by airmen. The
pattern was marked on aeronautical charts. This has long ceased
to be the case, but some grandfathered towers still use their
old assigned flash pattern.

>>Secondly, Do I have to put lights on my tower?

Perhaps. Read Part 97.15 carefully and apply the factors cited
to determine if you are in a location which may require lighting.
If lighting is required, you must notify the FAA. You are not
permitted to light a tower without their knowledge (and approval).
And any lighting you do use must be FAA certified. You can't just
hang any old lights up there. And once you're committed to lighting
the tower, you must keep the lights working. If there is a lighting
failure, you must notify the FAA immediately.

If you do need lighting, it may be considered a "major action"
by the FAA or FCC. In that case, be prepared for lots of paperwork.
The tower must be registered with both the FAA and the FCC, and
will be the subject of periodic inspections. In general, it is
better to avoid needing lighting, even if that means a lower
tower height.

>>>impact here.

And that's up from the 18% of a year ago. The thing you might want
to keep in mind is that fewer than 8% of Colonial Americans were
actively involved in the Revolution. But they prevailed anyway.

This isn't an issue that is likely to be resolved by mere popularity
among current licensees. The FCC is supposed to act in the public interest,
and their perception of that interest is much more likely to be shaped by
good arguments presented by activists, from either side, than it is by nose
counts of current licensees.

The tenor of Commission thinking, as reflected in public statements
on related issues in recent times, is not resonant with the arguments
put forth by the majority of pro-Code test activists. The current
Commission seems intent on using their position to facilitate the
application of newer technologies and promotion of more efficient
spectrum management strategies for public benefit rather than to act
as defenders of the status quo.

I thought this *IS* an internet site! While for the benefit of hams, it does not
require a license (vanity or otherwise) to read/reply. It also does not require
us to be civil or use "polite radio language."

One of my "proposed" vanity calls (W4DX) was also issued just before the opening of
Gate 2. It just makes you *WONDER* why, if someone was eligible earlier, they would
choose to wait 'till the last minute like that? Perhaps, as someone else suggested,
these people just upgraded in the nick of time to get these callsigns... knowing they
would certainly be issued quickly under Gate 2. If they were truly eligible, as
previously held or deceased related, then more power to them... I personally think
that was a good move by the FCC to accomodate those people.

I don't know any of the people in question, so I'm certainly not accusing anyone.
But I do hope that justice will prevail on anyone who did falsify their 610V. Its
not a perfect world, and one could easily suppose that some people have cheated. It
has happened at exam sessions in the past, and it has happened before with the FCC
issuing preferred callsigns. Anyone else remember those days... when you could "buy"
your callsign? You won't get many people to admit to it, but it happened. But so far, this still looks to be the "fairest" that the FCC has ever been with regard to special requests for calls. Hopefully it really is *FAIR*... and hams with "friends in high

places" have not gotten their application magically placed on the top of the stack.

Still trying to be civil... even on the internet.
Foul language available on request. ;-)
Waiting, with the rest of you, for a lucky break in the callsign lottery...

Best regards,
Stan/KD9BE

Carl,

You might wish to "watch the skies" next spring when amateurs
launch Phase 3D. Or get a copy of the "Proceedings" of the
latest digital conference or the last VHF conference. Or check
out some of the work written up in QEX in the last few issues.
Or peek over the shoulders of the guys at TAPR. Or subscribe to
the "Radio Designer" reflector. These are just a few
"visible" places, not counting all the quiet "invisible"
tinkerers, which suggest that "lazy, stagnated, technophobes"
is a somewhat innacurate set of descriptors.

Cecil,

Because developing the skills needed to receive code is much more
difficult than learning theory, if given the choice most hams would
probably elect not to attempt it (Well, actually they do have a choice,
but not on the HF bands). The ham who has never learned and used the
code on the air will never realize the attractiveness of the mode.

> I assume this is true of all pro-coders and even true of the

Cecil, I admit that part of the reason I am a proponent of the CW
requirement is to preserve it, for I fear that without some requirement
to learn it, it will become "an extinct species."

>RTTY is still being used, ergo, it has not been superseded by PACTOR.
>Morse is still being used, ergo, it has not been superseded by some other
>mode.

AM may not be completely gone, but it's usage (outside services where it is mandated by regulation) has dropped from nearly 100% of voice modulation techniques to about 1% or less in favor of SSB or FM. I'd be hard pressed not to say AM had been obsoleted by SSB and FM.

RTTY vs PACTOR is a similar situation, though not yet so extreme. The number of RTTY users is down sharply, and the number of PACTOR users is up sharply, to the point where PACTOR has become the most commonly used non-Morse text transmission method in the amateur service. The trend is clear, PACTOR is displacing RTTY. And as in the case of AM vs SSB, it is not just a matter of a fad. There are sound technical reasons why it is happening.

The same is true with Morse. While its use is declining very sharply over all radio services (albeit only slightly at present among amateurs), the other text transmission methods are gaining ground rapidly. For example, usage of non-Morse digital text operation has doubled even among amateurs in the last 5 years (according to ARRL surveys), while Morse activity has not gained share. Indeed, it is reasonable to say that Morse is well past its high water mark as a text transmission method. Like AM vs SSB, or RTTY vs PACTOR, Morse is being superceded by more efficient techniques.

These things don't happen overnight. It is often said that old paradigms don't finally die until their last adherent dies. But that's a reflection of a stubborn resistance to change, and not because there remains any superiority to the older paradigm.

Now this is all perpherial to whether code testing remains a valid requirement for an amateur license. Recreational horseback riding is actually a growing sport, with more riding horses in the US today than in 1900, but we don't require a test in horseback riding to obtain a driver's license. Our access to the roadway is not predicated on a demonstration of an activity which was once quite utilitarian but which today is only a passtime, albeit a popular one.

It's amazing what our old friend the inverse square law can do
for us when we use a little creative thought about the problem.
As noted at the FCC forum on new wireless applications, the spectrum
really does have infinite (or at least arbitrarily large) capacity
when we employ the right techniques to exploit it.

As "layering violations" go, this one is actually a fairly good idea.

Earlier this year I came up with another one that's similar. The problem I was concerned with is the congestion caused by TCP ACKs when streaming data at high speed over an asymmetric path (e.g., a cable modem). My solution is to implement mechanisms at the bottleneck router that drop duplicate acknowledgements when they're superseded by more recent ones. That is, when you're about to queue a new packet on a link and there's an older one for the same connection already in the queue, look at the older one to see if it carries any data or flags. If not, replace it with the newer packet. Since TCP acks are cumulative, the new packet can replace the older one.

I'd like to see more simulations of both ideas, but right now they seem pretty benign and workable. Both our "layer violations" consist of occasionally dropping a packet, something the Internet already does on its own so TCP is designed to deal with it. The important thing is that the packet is not *modified* in any way that might spoil the end-to-end integrity check.

Phil

Right. Some of the original research into coding was inspired by QRM from Navy shipboard radars. Because of the short duty cycle of the typical radar pulse, coding can be especially effective against it. This should interest us, given that just about all amateur spectrum above 222 MHz is shared with military radar.

> I agree with this as well. My plaint about overhead was about

> we've engineered the RF as well as we can in the traditional ways,
> then the overhead is no longer unnecessary.

I too used to believe that FEC was something you did when you couldn't make the link work without it, but I've changed my opinion on this. It belongs in *every* modern physical layer, because it always helps reduce RF power, increase user data rate and interference immunity. The only good reason for not using it in the past was the CPU intensity of decoding it, but today that's no longer a problem.

> I would caution that our amateur networks are often sparse.
> That leads to different tradeoffs in network topology than
> for a dense network where a SS microcellular approach might be
> better. Sometimes a beam pointed at a distant digital repeater
> is the right answer.

This is true, but it still calls for proper physical layer engineering in which coding plays an important part. BTW, ARQ can also be seen as a form of coding. The CRC is a high rate block code. The minimum hamming distance between valid codewords is too small to support error correction,

so "adaptive repetition coding" (i.e., retransmission of the same
packet)
is used. This works reasonably well at high SNR, but falls apart at
lower
SNR because the code just isn't well adapted to the channel.

3942. IARU First Report (Future) International Regulations

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-27 00:00:00 UTC
From: Jim Reid <jreid@aloha.net>
Message-ID: <01bbac0b$b6c370a0$54070ccf@jim-reid-1>
Source record: 216041
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.misc

The first report by the appointed committee to consider
the IARU April release of the Discussion Paper regarding
the future of the international regulations about the amateur
radio service. The complete text is posted at

www.iaru.org/fasc2out.html

The conclusion is copied below:

I would suggest that all interested in the future of the amateur radio
service to read this first report, and probably review the April
Discussion
paper about which it is commenting. Note that they continue to seed
input, even from individuals, thought it is the member country societies
whose input is still very much needed, particularly from the less
developed
countries regarding the qualifications of a radio amateur.

As the report states, things are moving even more slowly than anticipated,
so what else is new!

73, Jim, AH6NB

"12. Conclusion

While some have very clear views on a number of matters, it is clear that
many others, particularly the member societies are still investigating and
considering the issues.

It is also the fact that we have not received what we would regard as
sufficient (or any) input on some matters. An example is the lack of views
from the smaller societies, particularly from the less developed countries,
in relation to the question of the international regulations setting the
qualification for amateurs.

A number of those communicating with us have asked for proposals to put to
their administrations. We believe that is premature. There are, at this
stage, divergent views on many of the issues that are raised. The amateur
services will only succeed in achieving their objective if the member
societies speak with one voice, all taking a common view. That is not
possible at this time. For ourselves, we cannot offer any proposals that we
would feel confident either represent a view that would be acceptable to
the majority of either societies or amateurs, or, indeed, do we feel we
could be confident represents a position that we ourselves can say is the
best view.

Accordingly, we find that we are not able to make any recommendations at this time other than to recommend that the evolutionary process we have proposed should be allowed to take its course.

We continue to seek the views of individuals, groups and societies, and will be particularly interested in the discussions at the forthcoming regional conferences.

Finally, we repeat the suggestion we made in our Discussion Paper that the approach of each Region should be to formulate their view, but at the same time delegate the task of formulating a global policy to the Administrative Council after the Region 2 Conference in 1998.

The Future of the Amateur Services Committee

>Henry Silvia hrsil@flinet.com
>{KE4WBW} WPB. FLA
>

There is a proposed newsgroup on NetNews called rec.radio.amateur.boatanchors.
The Call For Votes has just been issued. Anyone with an e-mail address can
vote on whether or not this newsgroup should be created. There is some
opposition from some of the usenet community because they didn't like the name
"Boatanchors". There was much discussion of this and the hams were firm
in their resolve and did not change it to "antique" or "vintage".
Therefore we urge you to study the Call For Votes documents,including the
rationale and Charter and vote accordingly. The CFV documents may be
found in the rec.radio.amateur.misc newsgroup or send me (mc@shore.net) a
message and I will send it to you as an e-mail message.

If you want to vote on the creation of this newsgroup please send an
e-mail message to:

rrab@infobahn.net

no subject is required

I vote Yes on rec.radio.amateur.boatanchors

and send it....

That's it. You will receive confirmation on your vote being received.

You may also wish to vote against the creation of this newsgroup, in which
case change the word Yes to No in the text. (Equal time doctrine)!

We urge every ham with an e-mail address to vote in favor of the creation
of this newsgroup, mainly to have a public forum to discuss these matters
and also to let the usenet netnews gang and other net weenies that hams
will not tolerate being what to call our newsgroups just because THEY
don't understand the term. Funny, I have heard some computer geeks call
old PDP and IBM 360 series machines Boatanchors too!

Please vote on this issue and help the newsgroup get created. Then
subscribe and read it for a few times - you may like it!

73,

Michael Crestohl, VE2XZ/W1
mc@shore.net

In San Francisco, there's a wireless Internet service called
Ricochet, that uses zillions of part-15 low power transmitters
on 902-928 mHz to provide "radio modem" service throughout the
city. . .

Gary, you're quite right that improving the RF hardware will always help. That's so obvious I didn't even think it worth stating. :-)

More seriously, as nice as it would be to engineer good links, this just isn't always possible due to cost constraints, lack of good sites, zoning and deed restrictions, etc. So there's room for improvement at multiple levels; hopefully the sum of these improvements will be worthwhile.

You mention "fade margin". In the presence of relatively fast fading, i.e., fade intervals on the order of a transmission time, coding can be of even greater benefit than on a non-fading channel. Some numbers: a typical coding gain on an additive white gaussian noise (AWGN) channel (e.g., a satellite or deep space link) is maybe 5-7 dB. But on a Rayleigh fading channel, coding with sufficient interleaving can produce power gains of 30-40 dB, depending on the desired error rate (the lower the desired error rate, the bigger the gain of coding).

Rayleigh fading describes many real-world channels, including mobile radio, HF and EME. Of course, if the fade rate is too slow to cover with interleaving, coding won't be able to ride across the gaps. But in the vast majority of cases, interleaver spans that correspond to typical packet sizes are long enough to give significant benefit.

You also mention "overhead", an often pejorative term. Yes, the redundancy added by coding is "overhead" in the sense that it doesn't carry additional user data, but the payback is often in being able to run *more* user data than you could without the overhead, which means you still end up well ahead. Coding (of which spread spectrum can be seen as a special form) not only lets you use less transmitter power to achieve a given user data rate, but that lower transmitter power means less QRM to other users, and you are in turn more tolerant of QRM from other users. This is why coded spread spectrum systems are

the technologies of choice for commercial and military packet radio networks where it is no more practical to eliminate hidden terminals and put up big antennas than it is in the amateur service.

Phil

Satellite excels when the demand is for point to multipoint distribution of high data rate information. An example is distribution of television programming. Marginal transponder rental costs are currently about $400 an hour. To distribute a one hour program to 200 stations costs about $2 per station. That's about four times cheaper than the usual alternative of UPS shipment of videotape. It can also be more immediate, IE the program distribution can be "live".

Now the capital costs of such a distribution network are fairly high. Most of the cost is concentrated in the satellite (about $100 million), and in the uplink station (about $250,000). The cost of downlink stations is much less (from about $1,000 to $10,000), but there are a lot of them, so the aggregate cost is still $200,000 to $2 million for a 200 station network. To amortize those costs, the system has to have heavy loading.

Idle transponder time "costs" money because the satellite lifetime is finite. An unsold hour can never be recovered. So every unsold hour represents a finite cost increase for each remaining hour of the satellite's lifetime in order to recover the capital cost of the satellite. Idle time at the uplink and downlink stations is relatively less important because their capital costs are less, but they can still represent a significant burden on the owners of those systems. The capital cost of setting up to ship or receive UPS packages is insignificant compared to setting up to uplink or downlink the data. So again, high utilization is important to amortize the costs of these systems.

If distribution is point to point, the transponder rental time becomes the burden of a single user. This is a significantly higher

cost than UPS shipping. So satellite use for point to point carriage doesn't make sense unless the need for immediacy is overwhelming. Worse, since the uplink and downlink capital costs now have to be borne by a single customer, those costs' contribution to the hour's distribution cost increase by a 200:1 ratio as well. Scheduling the transponder's time for full utilization becomes a more difficult task as well, so the hourly rental increases in order to cover this. Typically, hourly rental for this sort of activity jumps to $1,000 an hour.

If the distribution is mulitpoint to multipoint, things rapidly get out of hand. Every station must now have uplink as well as downlink capability, adding about $50 million to network capital costs, and available transponder time becomes a bottleneck. It can take more than 400 hours to satisfy the needs of the 200 station network now. That is longer than the shipping time via UPS, and costs per user are much higher as well. So this latter type of operation is generally considered non-viable.

If we scale the data rate down, and scale the size of the network up, this model becomes even more applicable. For point to multipoint distribution, satellite becomes even more viable, while for multipoint to multipoint it becomes even less viable. The point to point case retains its sensitivity to end user capital costs. And in all cases the network has become vulnerable to single point failure at the most expensive node, the satellite.

Now the HF users who have moved (or who are considering moving) to satellites have done this cost analysis too. HF operation is essentially similar to satellite operation except that the transponder is "free", and unfortunately, less predictable in quality and availability. It is the latter factors which prompted most moves away from HF.

Fortunately, technology marches on. Use of modern digital modes with strong FEC, and perhaps using SS techniques as well, can upgrade the quality of the HF link to where it rivals that of the satellite link (for low rate data). And ALE techniques can compensate for the variability of propagation to a large degree. Uplink and downlink station costs are also modest. Thus HF is getting a fresh look by those who had previously abandoned it, or who had never previously considered it a viable medium for their communications needs.

Those stalwarts of HF usage, the international broadcasters, were widely expected to abandon HF for satellite a few years ago. The point to multipoint model benefits most from satellite distribution. But that appears to have changed now. There is a new digital broadcast system being pushed which offers most of the advantages of satellite without the costs of satellite. That's become viable because of the promise of consumer recievers using only one or two chips which can implement it.

Going purely on historical trends is dangerous. Technological change often means that simple extrapolation of past trends will be grossly in error. HF is getting a fresh look, and it is looking good to several potential users. On the flip side, the big and little LEOs are giving satellites a fresh look as well. It is difficult to determine now which way activity will move.

For high rate data, the move to satellite, and increasingly to fiber, is likely to continue. But for users with relatively low data rate requirements, HF has become a viable option once again.

>
>I'd suggest that you read my paper in the 7th ARRL CNC.

I've read it, it doesn't imply what you suggest above. The proper metric in any finite spectrum is information per second per Hertz. If the purpose of operating is not to convey information, then a simple dead carrier will suffice. And since that carrier carries no information, it can be stacked on a single frequency with all the other non-functional carriers, and reduce spectrum requirements to nil. Or alternately, since the absence of a carrier is equally meaningless if we aren't trying to convey information, there is no need to occupy spectrum at all.

But the purpose of communications is to convey information, so the proper metric in a finite spectrum is information per second per Hertz. Certainly the FCC considers it so, as Commissioner Susan Ness recently remarked.

Note of course that the Hertz don't have to be contiguous, as SS amply demonstrates. There are three axis along which we can pack information. Those are the frequency axis, used in FDMA, the time axis, as used in TDMA, and the spectral density axis, as exploited by CDMA. This latter isn't as easy to envision, but it essentially exploits excess SNR to pack signals into overlapping spectral bins.

As noted in your paper, there are occasions when we can exploit polarization or directional antennas to promote spectral reuse. But that's really perpherial to this discussion since it applies mainly to spectrum not under consideration here.

Gary

No one mandates that you spend the money and time to set up an AM
broadcast facility - afterall, you could construct an FM bcst station
more cheaply (considering the cost of the tower and acreage necessary for
the ground system). Yet new AM bcst stations are still appearing on the
dial.

>Internet, and keep the extra $600.

If you have a computer, why would you buy a TNC? You can decode Bell 202 with your sound card, or with one of those one chip Baycom thingies that you can slap together for about $5, and the protocol is easily implemented in software. Cost so far, zero to $5. And while I guess you could spend $400 for a new HT, why would you do that? A HT is exactly the *wrong* kind of radio to do packet. A $50 Motorola Maxar or GE MVP retrieved from surplus is a much better choice. So you can get on packet for $50. With a bit more soldering and tinkering, you can have 9600 baud for maybe $30 more in parts. So much for the cost argument.

>As for satellite or SSB work, an all-mode VHF/UHF rig costs more than a new
>computer. I think the point I'm making there is painfully obvious.

Yeah, the only way you know how to be a ham is with a credit card and an 800 number.

You want all mode cheap? Start with a fleamarket SSB CB, cost $25-$50, and build a transverter, parts cost under $75, and homebrew a beam, cost for materials, about $5. This isn't rocket science, and hams have been scroungers, modifiers, and builders from day one. It's what we *do*.

>Rig manufacturers need to cut their prices in half, and then do it
>again. The reason there's so many codeless hams that are inactive is
>because the equipment is so damned expensive.

No, it's because the only way you can imagine how to be a ham is with a credit card and 800 number.

>Even spending $400 to talk
>voice to the local guys is almost a waste of money, since(apart from
>local voice being booooring) they all meet every day to talk to each
>other face to face at a local donut shop...

Well, I can't help you there. The only way to make talking to the locals interesting, is to talk about interesting things. And the best way to do that is to be *doing* interesting things, like

figuring out ways *not* to blow $400 on a Gameboy handi scratchie.

That presupposes that Morse is attractive. Beauty is in the eye of
the beholder, and I for one find Morse very definitely unattractive,
in fact I find it downright ugly in its inefficiency. Being coerced
by government to take a speed test, and using it on the air, didn't
change that opinion, it *formed* it. Before starting to study for
my amateur license back in 1963, I naively thought the idea of Morse
was kind of neat. It was only after going through the process that I
realized how ugly it really was.

Almost half (44%) of current licensees seem to share my opinion, because
they told the ARRL (on its survey) that they *never* use Morse. Of the
remaining 56% who do, at least ocasionally, use Morse, we don't know
how many find it attractive and how many find it a nuisance that they
put up with because counting coup requires them to use it, IE they use
it for Dx gaming.

Well, at least that's honest, and a refreshing change from the bogus reasons advanced by most of the pro-code test crowd. I disagree, of course. I think each method should stand on its own merits in open competition. Let the best method win. That's how we "improve the breed".

Part of the cost of Morse is the wetware conditioning required, and the government speed tests serve to neutralize that cost by requiring even those who would use other less costly methods to pay it. That is effectively an artificial subsidy to Morse, just as a protective import tariff is a subsidy to inefficient domestic manufacturers, and makes the competition uneven. Worse, it removes the incentive to lower costs and makes all of us pay a higher than necessary price.

Without that subsidy, I think you are correct that Morse would, if not become extinct, at least become much less used. I would not be surprised, or disappointed, if it became like AM, something people tinker with only for nostalgic reasons. I believe that's as it should be.

>use of the HF spectrum.
>

By using CW??? That CW is not the most efficient use of HF spectrum is
an irrefutable fact. That's why commercial users abandoned CW years
(decades) ago ...

>> And the "it's expensive argument is a bit of a red herring, too ...
>> anything is expensive in small quantities ... but as the volumes go up,
>> the price goes down, and competition always arises, which provides
>> further downward price pressure ...
>
>The counterargument is that it's ALWAYS cheaper to use spectrum ineffiently.

Dollars are not the relevant figure of merit ... it's an equation like:
(value_of_activity*number_of_users)/(spectral_efficiency)

Besides, the newer techologies are not inherently more expensive than
the fancy "narrow band FM" radios you mention in the following
paragraph. Being more digital in nature, they may actually be cheaper
to produce ... they're just not being cranked out in comparable volumes
yet ... primarily because users are not being pressured to make
changes.

>Again, look at the current amateur use of VHF: in urban (read "large")
>markets, the spectrum is locked up by 20kHz wide "narrow band" FM. So I
>ask again, Carl, where are all of the cheap, spectrally efficient devices

>
>> The commercial land mobile people will no longer be able to use the
>> current "narrowband" FM in a short time ... new radios are being
>> mandated to meet tougher spectral efficiency standards in order to be
>> type-accepted ... we're falling behind all over ...
>
>So what you're saying here, Carl, is that the codefree license, according to
>your metrics, is a failure?

I'm saying that the RULES are not in keeping with the times and do not promote technical progress in ham radio, but rather they look to the past.

>Are you now, or have you ever been a member of ARES? Have you ever passed
>emergency traffic? Have you ever run a phone patch for someone in the Armed
>Forces? Have you ever heard someone give a sigh of relief when you tell them
>that their daughter is alive and well? If not, you might want to forget about
>the books and the soldering iron for a while, and do some real operating.
>

I recently moved to a new area and have not yet gotten involved with the local emergency comm groups ... (moving, new job, etc.)

However, for nearly 20 years in SoCal, I was VERY active in ARES activities ... for many of those years, I was a co-owner of a very wide area multi-site, multi-band VHF/UHF repeater system affiliated with state RACES/ARES and the state OES office ... I've spent hundreds (probably thousands) of hours working fires, floods, mudslides, earthquakes, etc. ... usually as NC of an area-wide VHF/UHF net supporting Red Cross disaster assessment and shelter operations ...

>any input. fleet@mbl.edu

If I follow what you are asking, you want to split off to two antennas,
one for HF and one for 6m, and you want to do that with a duplexer following
the AT180. It seems to me that if the duplexer has good isolation, that
should work just fine. The tuner just won't "see" the other antenna
when operating on the respective bands.

I would caution that the AT180 has a rather limited matching range,
it shuts down at anything over 3:1, and I wouldn't expect wonders from
it. This is actually to the good in your setup since a bad mismatch at
either antenna could adversely affect the isolation offered by the duplexer.
So your antennas will have to offer a reasonable match without the tuner,
and the tuner will serve mainly as a final "touch up" of the match. This
may not even be necessary. The IC706 is quite happy with any SWR below
2:1.

If you haven't yet bought the AT180, I'd be tempted to save the
money and just concentrate on getting a reasonable match at the
antennas.

3965. Vanity Calamity

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-28 00:00:00 UTC
From: <>
Message-ID: <52i23a$2pni@news-s01.ny.us.ibm.net>
Source record: 215962

Have you ever been so absolutely frustrated and aggravated with a situation that you can't even talk? I mean so tight-jawed, mad, that you just end up shaking your head? I've been waiting as well as a lot of folks for the FCC to figure out how they were going to do the Vanity Call's. There answer was like a lot of the crap that goes on in today's world. Vend it out! That way they can get the benefits,(30 bucks a pop) and put the blame somewhere else if it turns out bad.

I carefully picked out callsigns that I thought would be neat. Hell I even wrote a program two years ago that would parse the QRZ data base and provide me with a list of un used 1X2 and 2X1 calls. It took a little time and effort, but that was part of the fun.

So I waited for the 610-V to arrive in the SASE, and carefully filled it out, paying particular attention to legibility. (An issue according to what I had read). I went to the US Post Office and bought a $30 Postal Money Order. I didn't want any delay caused by waiting for a personal check to clear.

On Thursday the 19th of September I went back to the U.S. Post Office to deposit my application. "Will it get there by Monday?" I asked the local Postal guy. "Well, the only way to make certain is Express Mail". I said "O.K., but it can't arrive before Saturday afternoon" "No problem, we just check Second Day, and weekend delivery. It'll be there on Saturday!" Great, I thought, Eastern Indiana to Western Pennsylvania $10.75 what a bargain. At least it would be there on time. So I plunked down the money, filled out the form with the Postal Clerk and walked away with the receipt to check confirmation.

Monday the 23rd I called the US Post Office number to check to see when it was delivered. "Package delivered Friday". WHAT? How could that happen? This is a bad dream. Not bad enough I guess.

Today, Friday I called the FCC to see if there would be a problem with this. Yep, there was a problem. You see, they don't make deliveries so they weren't at fault there. They did a Pontius Pilate on the special delivery mail room that THEIR VENDOR had control over. They even could justify that they had deposited my $30. I would just have to request a refund after they played with my application for a few more days. You see THEIR VENDOR in their zeal, started entering apps on Monday morning before the OFFICIAL opening of the gate was blessed. So if you were one of the many folks that tried very hard to play by their rules, you may have got the short end of the stick. I was informed that not only had the US Postal Service made this mistake (SNAFU isn't that what

the politicians call it now? Some of us know what that acronym means!) but that Federal Express had errantly delivered too early. If your name is on the WIP (Work in Progress) list, your hosed. By the way, the notification procedure on this is when you get your app back in 2 or 3 weeks, you may request a refund.

I'll be vacationing in St. Martin/Sint Maartin later this winter, and was wondering about local operating (I have received my French license, but not my Dutch one yet -- I'll be staying on the French side of the island).

I'm wondering about the repeater (I see one listed on 146.76 in the ARRL directory). Is there much local activity, and any in English (my French is pretty rusty, and my Dutch doesn't exist)? What kind of coverage does it have?

I will attempt to tote an HF station (the Icom 706 is easy... the power supply is another matter, and I know I'll need a 220 volt primary). Any suggestions?

Thanks and 73,
Gary KN4AQ

You gave up too soon Steve! Novice tests in 1976 were given by ham volunteers. I think the FCC *may* have given the novice back then too.

I missed the 13wpm (heck, I missed the General Theory-there was no "Tech" theory back then) the first time too. My friend passed his General Theory but missed the code by >< that much.

I month later, I passed the theory but we both missed the code, he never went back and is still a tech, I gave it one more shot and passed the code (finally)!

Jim,

You are so cranked that you lost me about half way through your tirade!

You only have a "problem" if Mellon Bank stamped your 610V "REVD 09/20/96"

And even then, the FCC may cut you some slack and enter you as a "legal" gate 2 for Monday.

Your mistakes include assuming that personal checks have to clear (they don't), and that FedEX can't deliver anything early (they DO!).

My "Next Bussiness Morning" FedEx went out Friday and was signed for on Monday at 9:30am by the mysterious "Lock Box Supervisor (FedEx actually gave me a name)."

Looks like we all have a 1 in 5 chance. Keep your fingers crossed.

Here is a summary of news items covered on edition #183 of
"This Week in Amateur Radio", North America's satellite-delivered
audio bulletin service, for the week ending 4-Oct:
-
1. Thousands of Extra Class Licensees Enter Call Sign "Lottery"
2. DOD/MARS Stations to Abandon All CW Operations on October 1st
3. RAC Elections, VO1NA Leads New Newfoundland/Labrador Section
4. AMSAT-NA Re-elects KB1SF, W3IWI, and WA5ZIB; KA7LDN Alternate
5. Special Event Station Calendar
6. FCC Solicits Comments on IARP and CITEL/Amateur Convention
7. "Gateway 160 Meter Net Report" with Vern Jackson, WA0RCR
8. Shuttle Atlantis Lands after Completing Planned SAREX QSOs
9. Random SAREX Activity Reported Down Due to Work Schedules
10. Lucid Leaves Atlantis on Her Own, Gets Presidential Phone Call
11. California Ham Appointed New Stateside Mir QSL Manager
12. US House Passes "Space Commericalization Promotion Act"
13. Weekly Propagation Forecast
14. "The RAIN Dial-up" from Chicago
15. Arvid Anderson, W1RRS, SK, Helped Install Famous W1AW Rhombic
-
Funding for the program's transmission and production expense was
provided this week by a grant from Keith McQueen, N7HMF, of Orem,
Utah, where "This Week in Amateur Radio" is heard on the N7HMF
repeater on 448.025 MHz serving Provo, Orem, and Utah County.
-
"This Week in Amateur Radio" is a weekly amateur voice bulletin
service, produced by Community Video Associates, Inc., a New York
State not-for-profit corporation based in Albany, NY. The program
is heard on the "W0KIE Satellite Network" each Saturday at 9:00 PM
(EDT) on the Hughes Communications SBS-6 commercial communications
satellite, transponder 13B upper, located at 74 degrees west
longitude in equatorial geosynchronous orbit. The transponder
center frequency is 12.019 GHz; tune up in frequency to 12.031 GHz.
Program audio is on the 6.2 MHz analog subcarrier and carried on
VHF/UHF repeaters throughout North America and on 160 meters at 1860
kHz. Contact your local amateur radio club or repeater operator if
"This Week in Amateur Radio" is not being heard in your area.
-
```

Production and transmission expenses are underwritten by donations from repeater operators, amateur radio clubs, and individuals. Further information is available from George Bowen, N2LQS, at 518/283-3665 (email kxkvi@delphi.com) or Stephan Anderman, WA3RKB, at 518/664-6809 (email sanderman@delphi.com). You may also reach them @ WA2UMX.FN32AW.ENY.NY.USA.NA via amateur packet.

>Gary, you're quite right that improving the RF hardware will always
>help. That's so obvious I didn't even think it worth stating. :-)

Unfortunately, I believe that it is worth stating. Many packeteers
do seem to ignore the realities of level 1, expecting that the
"magic" of the packet protocol will fix any problems. As you note so
well below, level 1 coding magic can fix a lot of problems, but that
isn't the sort of thing the naive packeteer means. He expects level 2
ARQ to fix the problem. We both know that level 2 can sometimes make a
channel work for a user, but the cost is often reduced throughput
for everyone else sharing the channel.

>More seriously, as nice as it would be to engineer good links, this
>just isn't always possible due to cost constraints, lack of good sites,
>zoning and deed restrictions, etc. So there's room for improvement at
>multiple levels; hopefully the sum of these improvements will be
>worthwhile.

Sure. I agree that the problem should be addressed on all levels.
It is vital to consider the entire operation on a systemic basis.
Otherwise, some change we make in one part of the system may have
adverse effects on other parts of the system. The classic example
of that used to be the packeteer who put a big amplifier on his
station so that his throughput would improve. He didn't consider
the system, or the effect his big amp might have on users two
counties over. Today it is more often the packeteer who thinks
he can use his rubber ducky equipped HT to access a simplex LAN,
nevermind that he becomes a hidden terminal to 99% of the participating
stations and damages the aggregate throughput of the LAN in the
process. The whole network is a system, and must be treated that
way.

>You mention "fade margin". In the presence of relatively fast fading,

>vast majority of cases, interleaver spans that correspond to typical
>packet sizes are long enough to give significant benefit.

I'm with you on this, and I might add that such coding is just as
effective against noise pulses and interference which puncture packet
frames. It isn't just for weak signal use.

>You also mention "overhead", an often pejorative term. Yes, the
>redundancy added by coding is "overhead" in the sense that it doesn't
>carry additional user data, but the payback is often in being able

>QRM from other users. This is why coded spread spectrum systems are
>the technologies of choice for commercial and military packet radio
>networks where it is no more practical to eliminate hidden terminals
>and put up big antennas than it is in the amateur service.

I agree with this as well. My plaint about overhead was about
unecessary overhead. The better we can engineer the underlying
level 1, the less overhead we need to deal with impairments.
Obviously, if impairments are still a major consideration when
we've engineered the RF as well as we can in the traditional ways,
then the overhead is no longer unnecessary.

I see you are taking that a step further and advocating coding
as a primary level 1 engineering tool. One that lets us trade
off traditional level 1 RF engineering measures against coding
overhead. That offers us another way to map the topology of the
network, and may allow us to pack a higher density of users into
a given area than would be possible with traditional RF engineering
alone. I fully support that idea as an alternative method of
mapping the network. It isn't necessarily a better method, that
depends on other systemic factors in a particular network, but it
is another powerful tool in our toolbox.

I would caution that our amateur networks are often sparse.
That leads to different tradeoffs in network topology than
for a dense network where a SS microcellular approach might be

better. Sometimes a beam pointed at a distant digital repeater
is the right answer.

I try to remind people over and over that networking is a uniquely
cooperative enterprise, and that one size does not fit all. Often we
should take steps that don't necessarily directly improve our own
station's throughput so that we can effectively improve the throughput
of the network as a whole. When everyone does that, everyone benefits.

Gary

Hi Lindsay, most of the people I work with already know ten times the amount of theory they need to pass the written tests. It ain't exactly rocket science. The only thing standing in the way of a massive smartening up of ham radio ranks is that darn CW test. Please don't tell me there's always the tech license. Dr Williamson doesn't like being a low-class ham and neither do hundreds of other competent engineers who have already paid their dues in electronics.

China Kunming BY8SKM CQ CQ CQ
Hello !
This is HAM organization of Kunming, Yunnan, China.
As the first HAM body from China, we are excited to
extend greetings to all HAMs around the world. Our
organization was established and registered with local
authority on April 18,1996 as a non- governmental society.
We have got BY8SKM license and plan to open our radios
officially on Nov.23,1996, which will signify the end of
long blankness of HAM activity in the 8th area of mainland
China.
Now we have 47 members, among them are clerks,
communication professionals, teachers and entrepreneurs.
Their equipments are self-made or old military type. As HAM
activity appeared in China just several years ago, it yet
to be accepted by most people and generate more fans.
Now BY8SKM uses a BARRETT 550 made in Australia with
power of 100 w and operation mode CW.SSB.FM RTTY antenna.

Thank you very much for reading this message which aims
at getting to know more HAM friends since HAM language is
universal and HAM fans have kindred spirit. We hope to keep
a nice contact with you and develop an unlimited friendship
in the wireless space.
We would like to invite you to come to share the
festival of our BY8SKM openning. Yunnan is a wonderful
place that can touch and impress you with many picturesque
natural sceneries and unsophisticated and kind- hearted
ethnic groups.
Your coming and attending will be a great support to us.
If you could take part in such a HAM activity in a place
far from your homeland, you would be as excited as us. This
is the first time for Yunnan HAM Society to conduct
international exchange activity, we will well prepare it to
satisfy every guest.

Following is the activity agenda:
1. Opening ceremony of BY8SKM.
2. Discussion among HAM guests and host.
3. Exchanging of cards, presentation of T- shirts printed
with call sign, sun-hats and QLS cards to guests by
BY8SKM.
4. Yunnan 1000 km HAM DX along famous Yunnan-Burma Road
(Stilwell Road during the World War II) from Kunming to Wanding.

We are looking forward to hearing from you and welcome your advices.

Jin Feibiao
Chairman of Yunnan HAM Society

The HW-8 Handbook was compiled and published by Mike Bryce. Mike is an avid and active QRPer. The book covers both the HW7 and HW8. It has been through two editions. I believe you can still buy it from Mike. Mike is the QRP editor of 73 Magazine and the Publicity Chairman of the QRP Amateur Radio Club International (QRP-ARCI). I'm sorry I don't have Mike's address handy, but you can write to him at the address given in his 73 Magazine column.

Geez, Jim.....why didn't you do your homework? The FCC made it very clear that anything received after Friday Sept 20th would be datestamped with the next FCC business date, ie: Monday the 23rd. I, like thousands of others, mailed mine on Saturday morning by Express Mail and it was duly delevered on Sunday to the postal lock box in Pittsburgh.

Then there's the guys who had it shipped FedEx and didn't put the lock box number on the envelope on the inside of the big courier envelope....guess what happened to their apps?

My philosophy on this kind of the thing would be to make the rules of acceptance more stringent (specific size envelopes, etc) so that the people who could read, understand and comply with the instructions would have first shot at these choice calls.

I am sorry that your app was not in the bin dated the 23rd. But maybe the calls you want will still be available when they get around to your application.

73,

Michael Crestohl, KH6KD/W1 (W1??)

The way I see it, with 4500 first day applications from ALL call areas which averages to less than 450 per area and there being at least that many 1X2s, counting the W, K and N calls, we ALL should do pretty well.

Anyways, it gives us all something to look forward to......

73 and good luck to us all!

Michael Crestohl, KH6KD/W1 (hopefully soon W1JS or something equally cool!)

Which ng? You have posted to:

rec.travel.air,alt.radio.scanner,rec.radio.scanner,
rec.radio.shortwave,rec.radio.amateur.misc,rec.aviation.piloting

> that listed airlines that tested certian toys on their planes
>and found that they did not bother anything electronic on the plane
>and therefore allow you to use the toys.

I haven't seen any such list, and *every* airline with which I fly my
300,000+ per year *specifically* excludes such toys.

> it also listed airlines that
>tested toys and found them to be unsatisfactory for use on the plane.
>not all scanners and computers will harm the electronics on a plane.
>it all depends on the electronics that the plane is outfitted with.

I can't argue with that. But again, I make the point that if it's
against the airline's rules, you shouldn't be using them.

==========
Would it have been possible to: Attach a cover letter, clearly
explaining the situation, giving names and addresses of witnesses to
the applicants actual physical condition, and stating your suspicions
clearly and succintly, while recommending that this applicant be
required to undergo a different physician's examination, somewhat like
a ham might be re-examined if questions arose about his VE examiner?

Is there any rule preventing such a cover letter? Would there be any
concern that an applicant might sue a legally unprotected VE over such
a letter, claiming some sort of slander? Wasn't there a plan to
legally insulate VEs from such liability? How did that turn out?

Unless the VE has some recourse, we will be flooded by bogus
applicants.

What does the ARRL VE boss say about this?

> failure, you must notify the FAA immediately.

Hmmm... Please help me understand if this might affect my plans.

My tower, at 87', went up, with the FAA in the loop, and does NOT require lighting. However, as it sits in the center of my front yard, it looks to me like a great place to mount motion-detector triggered floods to illuminate the front of the house when a visitor (or intruder) is sensed. I planned to experiment with height, but expect that the lights would be mounted somewhere in the 10' - 20' above ground level.

Is this a violation of the regulations that you are referring to?

And another question: what special precautions should I take when feeding 115vac service to these floods? I have a 5", schedule 40 PVC pipe that runs from my basement to the tower base with all of the feedlines and rotator control wiring, and planned to run "underground" type A/C cable through that with a Polyphaser IS-ISP-240 protector mounted at the base of the tower. Should I tie the ground wire of the 115vac line to the tower base ground and radial system at this point too?

Any help would be appreciated. Thanks and 73,

Stan

Hi Chris,

How have you been you seem to have healed from the 9600 baud wars OK.
At last glance Drew had HF access. Being a Tech+ he can work CW on
several bands as well as phone on the most active part of 10 meters.
I do understand your sentiment since you still seem to be a Tech-
without any code at all.

Take care

I have an Icom IC-R71A Short-wave receiver for sale with matching Icom IC-SP3 external speaker and Icom RC-11 remote control. I am also including the Autek research QF1A SSB/CW/AM filter.

Condition of this RC71A is exceptional. No Blemishes scratches etc. Speaker and peripherals are like new including the QF1A from Autek research.

The Icom IC-R71A covers 100Khz-30 Mhz
100Db of dynamic range
Passband Tuning
Adjustable notch filter
Level and pulse width
Selectable noise blanker
Selectable AGC
Filter switches
Keyboard frequency entry
SSb--AM--CW--RTTY and optional FM
32 memory channels
optional CW narrow filters

The Package price is $775.00 Transaction via UPS COD. {Free shipping UPS COD via UPS regular to CONUS}
Package only it is not being broken up.

>probably elect not to attempt it (Well, actually they do have a choice,
>but not on the HF bands). The ham who has never learned and used the
>code on the air will never realize the attractiveness of the mode.
>

Many, many of us long-licensed no-code advocates, who obviously learned
the code to get our licenses, still find the code to be *exceedingly*
UNATTRACTIVE ... how does the pro-code "logic" explain this pheomenon?

Also, if we had DECENT written tests on theory, your assertion that
"developing the skills needed to receive code is much more difficult
than learning theory" would not apply ...

You seem to be amongst the crowd that:

a) feels the code should be preserved at all costs, whether newcomers
are interested in preserving/using it or not
b) feels that some hurdle or barrier must necessarily be overcome to
prove that the necomer is "worthy" to be a ham
c) feels that the code is th ONLY suitable hazing ritual to satisfy b)

>Cecil, I admit that part of the reason I am a proponent of the CW
>requirement is to preserve it, for I fear that without some requirement
>to learn it, it will become "an extinct species."

And that would be the "end of the world", right? (NO, NO, NO!!!!)

If the code is (as some of us assert) so practically useless in today's
technological society, then maybe it should go the way of the Dodo bird
.. though I doubt it ever will ... I believe that there will probably
always be a small group of adherents who will practice it and encourage
others to learn and use thie code ... this is fine and good ... but
that's a far cry from forcing it down everyone's throats by government
mandate. (Which is what we seek to end.)

Please rethink your position ... you can be one of the "keepers of the
faith" and encourage the learning and use of the code by newcomers ...
without being a tyranical dictator and forcing it on them ...

DC> for nostalgic reasons.
Dave-
I have no problem with a special-interest group forming a newsgroup,
and calling it anything they want. Good luck in your endeavor.
What I want to call attention to, is that some Hams have a different
definition of a Boat Anchor. I think many (if not most) of us use the
term in a derogatory manor. A Boat Anchor isn't just an old rig - it is a
rig of ANY age that no one would want to use if they could help it.
At a Hamfest, the Boat Anchors are the rigs that are still on the
tables at closing time of the last day. They are the ones that their
owner will abandon on the swap table, and the Hamfest committee will toss
into the dumpster. Many are AM rigs with high-current power supplies full
of iron. Thus, they aren't good for anything except for use as a Boat
Anchor! THAT is how they got the name, and there is little nostalgia
attached to them.

>of those hams was Curtis LeMay; after having used it himself, he ordered a ton
>of S-Line gear from Collins for SAC.

Art Collins and Gen. LeMay took a round the world flight in a SAC bomber carrying Collins' new SSB transceiver. The communications to and from SAC bases were so superior to what they experienced with the older AM equipment in direct A/B comparisons that LeMay immediately instigated a changeover at SAC to SSB.

If my memory hasn't gone South, I believe the radio was the KWM-1, and not the S-line. That came later, and I don't believe it was used airborne. Eventually the military ordered tons of KWM-2s for all sorts of communications jobs, some of which may still be in use today in some third world military. or our National Guard. :-(

Amateurs were starting to use SSB before this event, but mostly with unstable phasing rigs. It was the Collins filter rig, which could withstand the rigors of combat aircraft flight, that made it possible for SAC to convert to SSB.

Amateurs gravitated to filter rigs as well, though not as quickly due to the cost. There were still phasing rigs in use in the 1960s. I remember a particular HT37 which was more often a DSB rig than a SSB rig. Other manufacturers tried other types of filters, and the crystal filter became the standard of the less expensive amateur SSB radio.

As these things sometimes go, the price of the mechanical filter has declined, and the performance of the crystal filter has improved, so that the two are now nearly equals. But now really practical and stable phasing systems are becoming feasible, and the mechanical and crystal filters may have seen their day as the

centerpiece of the HF radio.

>whistle, smoke, you name it!). That can be important
>in an emergency.

I believe the native Americans used smoke signals without knowing Morse, or passing a government test. Fancy that. And ancient Romans used heliographs without knowing Morse. Whistle signals are as old as warfare. Etc. There is nothing mystical about Morse which makes it possess qualities not available with other codes.

>Most of us do NOT carry equipment capable of combined
>FH/PN spread spectrum communication using
>sophisticated error correction algorithms.

Perhaps you should. The military does. CDMA cellphone users do. Silicon is cheap, manhours and spectrum are expensive.

>I'd like to see you decode FSK by ear...

As a matter of fact, I can decode RY and my call sign by ear when operating RTTY. Of course the speed is 60 WPM, and I doubt you could do better with Morse. Slow it down to 13 WPM, and it is not significantly different to decode RTTY by ear than it is to decode Morse by ear. In fact, the first CW was FSK because the arc transmitters used to generate CW couldn't be keyed on and off, but were shifted between two frequencies by the key. Thus the first FSK operators *did* copy by ear. Of course what they copied was sent *very* slowly by machine standards.

Come back when you can reliably send and receive 60 WPM Morse without mechanical aid. Oh, wait, did I tell you I'm using Clover now? Come back when you can do 470 WPM Morse without mechanical aid.

4002. IPS Daily Report - 28 September 96

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-28 00:00:00 UTC
From: rwc@ips.oz.au
Message-ID: <52kc3k$4ht@flare.syd.ips.oz.au>
Source record: 215999
Cross-posted to: aus.radio.amateur.misc,ips.solar.activity,rec.radio.amateur.misc,rec.radio.info

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 28/2330Z SEPTEMBER 1996 BY IPS RADIO AND SPACE SERVICES
FROM THE AUSTRALIAN SPACE FORECAST CENTRE
SUMMARY FOR 28 SEPTEMBER AND FORECAST FOR 29 SEPTEMBER - 01 OCTOBER

1A. SOLAR SUMMARY
Activity: Very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 71/6

GOES satellite data for 27 Sep
Daily Proton Fluence >1 MeV: 2.0E+06
Daily Proton Fluence >10 MeV: 1.8E+04
Daily Electron Fluence >2 MeV: 2.2E+08 (moderate)
X-ray background: A1.5
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
29 Sep 30 Sep 01 Oct
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 29 Sep: 70/5

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: Unsettled

Estimated Indices : A K Observed A Index 27 Sep
Learmonth 13 2333 3332
Fredericksburg 18 18
Planetary 15 13

Observed Kp for 27 Sep: 4444 3212

2B. MAGNETIC FORECAST
Date Ap Conditions
29 Sep 15 Unsettled
30 Sep 13 Unsettled
01 Oct 30 Active to minor storm
COMMENT: IPS Geomagnetic Warning 11 was issued on 28 September
and is current for interval 30 September to 1 October. Activity
is expected to briefly decline until 1 October, when active to
minor storm levels are expected due to another coronal hole.

There now appears to be two coronal holes is close proximity
to each other on the visible solar disk.

3A. GLOBAL HF PROPAGATION SUMMARY
Latitude Band
Date Low Middle High
28 Sep Normal Normal Fair
PCA Event : None

3B. GLOBAL HF PROPAGATION FORECAST
Latitude Band
Date Low Middle High
29 Sep Normal Normal Fair
30 Sep Normal Normal Fair
01 Oct Fair Poor Poor
COMMENT: HF conditions at mid-high latitudes are expected to
become degraded on 1 October in association with expected geomagnetic
activity.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Date T index
28 Sep 7

Observed Australian Regional MUFs:
Darwin: enhanced 30% 00-03UT. No data 03-24UT.
Townsville, Sydney, Hobart: near predicted monthly values.

Predicted Monthly T index for September: 9

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
Date T index MUFs
29 Sep 5 near predicted monthly values
30 Sep 5 near predicted monthly values
01 Oct -10 10 to 30% below predicted monthly values
COMMENT: Degraded HF conditions expected during interval 30 September
- 1 October. Depressions of 10 to 30% expected for southern region
(mid to high latitudes), Northern region (low latitudes) should
continue to use monthly T index of 9.

Why pay for something when you can get it FREE? The FCC makes its Amateur Radio Callsign Database available from its FTP Site. The entire database is updated every Monday with daily updates for calls issued every day.

However, the database as downloaded is of little use. I have written a program that takes this "raw" database, converts and condenses to an usable database which can be searched by callsign. The name and address will be displayed and a label can be printed if desired. I am making this program available as FREEWARE and it can be downloaded from my "FCC DB" web page URL: http://www.surfsouth.com/~jhardy/fcc.htm or there is a link from my home page.

You can get the same data by buying a CD from one of the commercial suppliers such as QRZ, BuckMaster, SAM, CallBook, etc., but my method will be much more current and can be updated FREE at any time instead of buying another CD. Of course, the same data is provided free via the various web pages (QRZ, BuckMaster, etc) but you have to be online to access these.

By using this approach you could also provide this database to your local hams that are not on the Internet by giving them copies on floppies. Or if someone had access to a FTP site that had spare room, the database could be stored there and updated weekly. The condensed database requires about 34MB of hard disk space, but this has over 720,000 calls in it.

Drop by my web site and download this program and give it a try. If you have any questions email me.

4006. Re: Digital/Analog HF Receiver Design

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-28 00:00:00 UTC
From: gary@ke4zv.atl.ga.us
Message-ID: <1996Sep28.054856.2427@ke4zv.atl.ga.us>
Source record: 216003

In article <32496374.4E0A@erols.com> howard@erols.com writes:
>Hey, Jim, don't let these guys get you down. They're in a purgatory of
>frustration at the moment, having good theory but lacking the elemental
>building block of an adequate (24 bit, 90 MHz) A/D converter for HF.

Not so. Sony has the AD9040, which is cascadable to 24 bits.
It was developed for HDTV digital video recorders, 230 Mbps.
Ok, it is $165 *now*, and you have to cascade three of them,
but that'll come down as it goes into volume production. The
problem then becomes a DSP fast enough to deal with all the
data it produces if you insist on doing direct to digital
instead of I/Q sampling. I don't think direct digital will
be viable for some time to come.

>Although you can subsample with lesser converters, that only begs the
>question since the desired signal must be known to be bandlimited
>adequately or you get tons of garbage. Without preselection (which is
>why it begs the question) subsampling will not do wideband .5 - 30
>MHz... The logical question is "When will the desired A/D converter be
>available?" I am still waiting for that answer!

You have it. But who says preselection isn't possible? Hell, my
old Drake 2B had it, why can't I put some in front of a synchrodyne
I/Q DSP receiver? I don't need a whole lot, just enough to keep the
diode ring mixers from generating cross modulation products. The
brickwall filters are at baseband in the I and Q channels. They don't
have to be tunable.

This answers your objections completely. The sample rate for the
I and Q channels only has to be 2x the passband of the receiver,
and that's an audio rate. Now we have DSP chips that can handle
that.

>The EM interference at 900 MHz is not to be compared with that
>at HF. That is one reason that this PCS gear can be made for $1.98 -
>the required distortion performance is a lot less. I worked on an HF
>receiver/preselector that had to deal with 100V 10% off-frequency. I
>have also worked with with HF full duplex, and its essentialy unsolved
>co-location problems. I don't think UHF has many equivalent
>situations.

That's certainly tough. However, within 10% bandwidth at many urban
sites there may be 12 or more 350 watt transmitters co-located with
my equipment and with their antennas separated by only a few feet from
mine. At one site here, I get 20 watts reflected on the Bird with my
transmitter OFF. That's within 20 db of the situation you describe.

>Another advantage is that the problem to be solved at 900
>MHz is narrowband. Compare the %BW at 900 MHz with the multioctave BW
>at HF, and it's a different ballgame for many system blocks, such as the
>synthesizer, front-end filtering, spurious management, etc. The IQ
>crowd always seem to wind up with a fixed IF to work with -- it must be
>nice. Note that in every instance they rely upon analog techniques to
>give them that fixed IF.

I and Q are *baseband*. I don't know how you got some other impression.

>Come to think of it, I'm not sure but as I
>recall 24 bit A/D technology is stuck somewhere down around a sample
>rate of 10 Hz or so. Maybe more. I dunno.

Obviously not. Successive approximation converters can be that slow,
but flash converters certainly aren't. Fast 8-bit flash converters have
been common for a while, but cascadable flash converters have not.
No more. Silicon exists. It takes three clocks to get a complete
sample conversion, but there's speed to burn with the new chips
developed for HDTV.

There is another way too, and it looks cheaper for now. I can use a
1-bit converter and oversample. I have to oversample really fast to get
24 bits, of course. I'm researching that now.

>There is one thing which could make the whole discussion moot, at least
>to the point of a new receiver design which would at least equal the
>performance of current designs. That would be if a filter were
>available which could be tuned and which would provide the desired
>ultimate selectivity across the HF range at the antenna. In other
>words, a 2.7 KHz "ideal" filter which could be tuned from .5 to 30 MHz
>for SSB voice, for example. That would mean that the only signal
>present would be the desired signal. And that would mean that optimum
>receiver architecture would be completely redefined. The common
>problems of today would be in many cases nonexistant. There would no
>longer be a need for superheterodyning, since the initial problem it
>solved was to get the desired signal to a low enough frequency (while
>retaining performance) so that the desired selective filter could be
>made. So the HF problem would start to look a little more like 900 MHz,
>eh? One could then use some simple down-conversion technique and be
>done with it. This filter may come about before the aforesaid A/D
>becomes available.

You seem confused between I/Q synchrodyne receivers and direct
sampling receivers. You can't get I/Q by direct sampling. (Well,
Ok, you can, but that's a bizzare way to do I/Q.) Anyway, an I/Q
receiver does its brickwall filtering at I/Q baseband and then
samples that for DSP processing. It's not *super*hetrodyne
technique, it is *synchro*dyne technique. If you don't think
that can work at HF, tell all the R2 receiver users. Those
little opamps seem to be able to handle the filtering chores
nicely (but not as nicely as we can in DSP).

Here's what I'm doing now. I take the I and Q outputs of the
R2 mixers and feed them into the Analog Devices EZ-Kit DSP
board. The codec there has the necessary brickwall filtering
and samples the signals at 44 kHz. I take the codec outputs,
do a Hilbert transform on one channel while delaying the other
channel an equal number of clock cycles. Then I use identical
FIR filters on I and Q and combine the outputs of the two
filters. That gives me recovered and demodulated SSB. By
switching the Hilbert transform routine to the other channel,
I can get the other sideband. By manipulating the coefficients
of the FIR filters, I can vary the passband response to any
filter shape I want.

I can do other things with I and Q as well, I can
demodulate QPSK for example. That's my main focus.

Of course since the codec on the board is only 16-bits, I don't
get the dynamic range I want, presently only 48 db (though I
have 30 db more in software controllable gain in the codec).
But as noted above, that won't remain a problem much longer.
And just as well that I'll be going to separate converters
because the stereo codec I'm using now only has 80 db of
channel to channel isolation, and that's not going to be
enough when I go to 24 bits.

I will need a DSP with wider registers to handle 24 bits,
and a faster clock wouldn't hurt, I'm running out of
processor cycles. Fortunately that exists, but it is still
a bit expensive.

(Of course if I were a better DSP programmer I probably
could do this much more efficiently. At present I'm just
a cut and paste hacker of a rather crude sort. A real DSP
programmer should be able to make this thing sing.)

>
>Thanks
>
>Steve
>WB7PSD

It varies.......You can get your call on the internet 3 am the morning after the FCC files it,
on the internet. If your VEC inputs the 610 through his computer & modem that can be as little as a few hours. When I upgraded I took the test at 10 AM. By 9 PM that night I had my call. The FCC is downloading later now (3AM East Coast time). You can operate as soon as you know your call.

As far as getting the ticket in the mail I got mine in 4 days in California. I hear it's 4 days
to 2 weeks depending on the Mail.

> (decades) ago ...

No, as a matter of fact, it's quite refutable. Carl, what other mode in widespread use in the amateur service packs the most QSOs per kHz? You've had a week to support your supposaid "fact" with some numbers, but have failed to do so.

> Dollars are not the relevant figure of merit ... it's an equation like:

Outside of academia, dollars are *the* figure of merit. Ham Radio purchases are *very* cost sensitive. To claim that you don't care what it costs smacks of elitism.

> (value_of_activity*number_of_users)/(spectral_efficiency)

Buried in this equation is a very dangerous idea: that some QSOs are more valuable than others, an idea wholly repugnant to the First Amendment. After all, who can make such a judgement? A more objective figure of merit would be:

(# of QSOs)**2 / (Hz) * (Total Equipment Cost)

> Besides, the newer techologies are not inherently more expensive than
> the fancy "narrow band FM" radios you mention in the following
> paragraph. Being more digital in nature, they may actually be cheaper
> to produce ... they're just not being cranked out in comparable volumes
> yet ... primarily because users are not being pressured to make
> changes.

Okay, so where are they? There's no "code blockage" on VHF technology, and everyone new is going straight to the wideband technology. Why shouldn't we expect the same to happen with HF?

Incidentally, the efficiencies available to VHF+ Spread Spectrum don't translate to HF. For starters, the available chip rate is much, much lower, given the scarcity of spectrum. For another, it's extremely difficult to get orthogonality in a Rayleigh fading environment. The only practical and longterm use of spread spectrum on HF has been radiolocation, and it works quite well, given the relatively low information rate and lack of reuse.

> I'm saying that the RULES are not in keeping with the times and do not
> promote technical progress in ham radio, but rather they look to the
> past.

So what you're advocating is not only the elimiation of the CW exams, but of HF SSB as well? After all, you've pointed out repeatedly that these kinds of changes have had to be forced onto land mobile.

What you are therefore advocating is a change from a system that works to one whose technology doesn't even exist, will outlaw all existing equipment (thereby making it worthless), and will require more capital outlay from every single user. And for what reason? Why should we all pay more for a system that will, in all likelihood, be about as efficent as the current system?

The technical "facts" you've presented do not support your position, and the empirical facts from 5+ years of the codefree tech disprove it.

From: leader@aztec.asu.edu
Message-ID: <52l60m$4cb@news.asu.edu>
Source record: 215822

I would like to find the testing dates in the Phoenix AZ metro area.

Is there a site which would have these updated as needed?

Also - I called the ARRL 1 800 number for info about HAM radio. They said they would send out some info (not being a ham yet), and it should arrive in 3-4 wks. I called back two months later, asking about the materials, and the person with whom I spoke said if I requested them, then they must have been sent - period. Is this typical of ARRL service/treatment?

I also contacted the ARL (Az something League). They too took my name and address and promised info to be sent out shortly. Nothing yet (before the ARRL incident).

Hopefully I will meet somebody in this hobby who is friendly and helpful. Else I will sell the radio I purchased so enthusiastically.

June 1995

Scanning Aboard Airliners

The question of the use of scanning receivers aboard commercial
airlines arises from time to time. The following is an extract from
the FAA Regulations (FARs) and the stated positions of a number of
major carriers.
It should be noted that in FAR 91.21, the term "operator" refers
to the airline, not the pilot. The captain on your flight may impose
additional restrictions depending on conditions, but he may not waive
limits established by the airline.
The quotations from various airline policies were correct as of
the date noted, but are subject to change. If any question arises, ask
the cabin attendant to check with the flight crew, then obey their
instructions. I may be on the same flight, and I would prefer that
stray R.F. not vector us into the side of a mountain.

Federal Aviation Administration Regulations
14 CFR 91.21 - Portable Electronic Devices

(a) Except as provided in paragraph (b) of this section, no person may operate, nor may any operator or pilot in command of an aircraft allow the operation of, any portable electronic device on any of the following U.S.-registered civil aircraft:
(1) Aircraft operated by a holder of an air carrier operating certificate or an operating certificate; or
(2) Any other aircraft while it is operated under IFR.

(b) Paragraph (a) of this section does not apply to -
(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers; or
(5) Any other portable electronic device that the operator of the aircraft has determined will not cause interference with the navigation or communication system of the aircraft on which it is to be used.

(c) In the case of an aircraft operated by a holder of an air carrier operating certificate or an operating certificate, the determination required by paragraph (b)(5) of this section shall be made by that operator of the aircraft on which the particular device is to be used. In the case of other aircraft, the determination may be made by the pilot in command or other operator of the aircraft.

Delta Air Lines
from the "On Board" section of SKY magazine, January 1995

PORTABLE ELECTRONIC DEVICES - Current regulations prohibit the use of certain types of portable electronic devices (PEDs) on board commercial aircraft, due to the potential for interference with navigation and communications equipment.
The following devices may not be operated at any time on Delta aircraft: cellular telephones, commercial two-way transmitters (i.e. walkie-talkies); amateur transmitters (i.e. ham radios); citizen band (CB) transmitters; 49 MHz transmitters; devices designed to radiate RF energy on a specific frequency; peripheral devices for computers or games connected by cable (i.e. printers); AM/FM radios and portable TV sets; remote-control toys.
The following may not be operated when the aircraft is at the gate, in the taxi, take-off, initial climb, approach, and landing phases: personal computers (cable-connected peripheral devices such as printers, external disc drives, etc, are not authorized); personal computer games; VHF scanner receivers; compact-disc players; digital/ cassette-tape player-recorders; video recorders/playback systems; calculators.
The following may be operated at all times: hearing aids; heart pacemakers and other implanted medical devices; electronic watches;

electronic nerve stimulators; properly certified operator-installed and -maintained equipment, such as the public passenger-telephone equipment. Personal life-support systems may be operated during all phases of flight, provided that the equipment conforms to the criteria established by the administrator of the Federal Aviation Administration (FAA).

United Airlines
press release

UNITED AIRLINES PROHIBITS USE OF
PORTABLE ELECTRONIC DEVICES DURING TAKEOFFS AND LANDINGS

Chicago, June 22, 1993 -- United Airlines today announced that effective July 1, it will prohibit the use of portable electronic devices, such as laptop computers and compact disc players, onboard its aircraft during takeoffs and landings.
United said its policy was developed to address the possibility of such devices causing electromagnetic interference with cockpit navigation or communications systems when aircraft are on the ground or flying below 10,000 feet -- the most critical phase of aircraft operation.
"We have not experienced any safety problems with these devices, but enough questions have been raised in the industry to prompt us to implement this policy as a precautionary measure until further study determines if any safety hazard exists," said Ed Soliday, United's director-corporate safety and security.
Excluded from the new policy are electronic medical devices -- such as hearing aids and pacemakers -- and electronic watches, which may be used onboard an aircraft at any time.
United said when an aircraft is flying at or above 10,000 feet -- which normally occurs within 10 minutes of takeoff and until 10 minutes before landing -- passengers may use the following devices:
o compact disc players;
o electronic cameras (film or video);
o electric shavers;
o hand-held electronic calculators;
o hand-held electronic games;
o portable audio tape players;
o portable video players (tape playback only);
o portable voice recorders (dictation equipment);
o portable computers with accessory printers and tape or disk drives.

-UA-

American Airlines
from the "Vantage Point" column of American Way magazine, July 1993

[....]

Products known to cause problems include cellular phones, portable radios and televisions, and remote-control toys, which federal regulators have long barred on commercial aircraft. (The Airfones available on most of our airplanes are specially engineered to eliminate interference with aircraft systems, and they have been thoroughly tested to ensure that result.)
The jury is out on whether other devices - small computers, compact-disc players, hand-held video games among them - have similar effects. Although scientific studies have been inconclusive, there is mounting anecdotal evidence of sporatic and poorly understood problems. When safety is at stake, taking avoidable risk is simply unacceptable. That is why some air carriers outlaw the use of electronic devices during all or part of their flights. American Airlines announced recently that it will no longer permit the use of such devices during takeoff and landing, and while flying at altitudes lower than 10,000 feet, the phases of flight during which cockpit instruments are used most intensively.

[....]

Atlantic Southeast Airlines
from the ASA Flight Attendant Manual, pp 3-49&50, November 2, 1993

3.13. Portable electronic devices

A. Regulations

The FAA prohibits use of electronic devices such as AM/FM radios, cellular telephones, etc. during flight. These receivers have circuits which can radiate signals strong enough to interfere with the aircraft's navigational systems. Non-transmitting portable electronic devices shall not be used during takeoff and landing when the seat belt sign is on, or when directed by a crew member, or during operations below 10,000 feet. However, non-transmitting portable electronic devices may be used at other times. If interference from the portable electronic device is suspected, the captain may prohibit operation of the device.

1. Prohibited equipment
The following may not be operated at any time on ASA aircraft:
a. Cellular telephones.
b. Commercial two-way radios (i.e. Walkie Talkie).
c. Personal two-way radios (i.e. Ham operators).
d. Citizen Band (CB) radio.
e. 49 MHz Transmitters.
f. Peripheral devices for computers or computer games
(i.e. printers, external mouse, "joy sticks").
g. AM/FM radios and televisions.
h. Remote controlled toys.
i. Devices designed to radiate radio frequencies (RF) energy on

specific frequencies.
j. Cassette tape players with AM/FM radio capability.
k. Cpmpact Disc players.

2. Acceptable equipment
The following may be operated when there is not a sterile cockpit in effect. The devices must be turned off when the seat belt sign is turned on for approach.
a. Personal computers (see restriction f above).
b. Personal computer games (see restriction f above).
c. VHF scanner receivers.
d. Digital cassette tape player-recorders.
e. Video recorders/internal playback systems.
f. Calculators.

3. The following devices may be operated at all times.
a. Hearing aids.
b. Heart pacemakers or other implanted medical devices.
c. Electronic watches.
d. Electronic nerve stimulators.
e. Electric shavers.
f. ASA installed equipment.
g. Pagers.
h. Acceptable personal life support systems.

Southwest Airlines
(from correspondence dated 12 April 95)

Ground Operations Customer Service Manual -

The FAA allows inflight use of headsets, portable computers, calculators, and electronics games, provided they can be stowed properly in accordance with this rule. Customers should be requested not to use these devices during takeoffs and landings. The FAA does not allow inflight use of walkie-talkies, radio controlled toys, AM/FM radios, portable telephones, or portable television sets, all of which may affect aircraft radio and navigation equipment.

Safety Cards -

Portable Electronic Devices Not Acceptable
Telephones
Radios, AM/FM, VHF, battery or cord operated
TV sets -- battery or cord operated
Electronic games or toys with remote controls
Computer, calculators, or typewriters larger than a briefcase and cannot be stored under the seat
Data entry pad, hand held with umbilical cord attached

actually I have possted to a lot more than that but I don't think that
I said that I posted it. If that is what i wrote it is wrong.
someone else posted it. I only read it

>I haven't seen any such list, and *every* airline with which I fly my
>300,000+ per year *specifically* excludes such toys.
have you flown with every airline?

>I can't argue with that. But again, I make the point that if it's
>against the airline's rules, you shouldn't be using them.

can't argue there. I am not saying use them. I simply stated that I
saw a list that showed airline that WOULD let you use them

4023. BETA TESTERS NEEDED FOR PA QSO PARTY LOGGER

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-29 00:00:00 UTC
From: N3LAI@radix.net
Message-ID: <324e3249.1842514@news1.radix.net>
Source record: 215825

Hi All,

I hope I don't offend any one by posting this off-topic message. If I do, I sincerely apologize.

I'm looking for people to test a logging program I created for the Pennsylvania QSO Party contest. I could not find any good logging programs for the contest that were Windows programs, so I decided to make one. Well, it's done to the point I can't elicit any errors. I need some people to "push some buttons" and see what happens.

The only thing I can offer in return for your help is a copy of the software at no charge. This will include any and all updates to the software any time I make any. I'm planning on making changes at least once each year as the new rules and/or sections come out.

System requirements are a 486 or better processor with 8 MB RAM (that's the only computer I've tested it on) and Windows 3.x, Windows95, or Windows NT. Approximately 5 megabytes of disk space is required for installation, and additional disk space for the log files.

If you're interested, please contact me by e-mail and I can e-mail you a copy (3 disks) or I can post it to the Newsgroup.

Thanks In Advance,

Chuck Spafford - centrex@radix.net

While eves-dropping I came across your post. I have been a ham for quite awhile but usually monitor a couple of frequencies in my area. Though licensed for a few years 9Tech plus) a have not been awere of the Vanity Call sign progrom. Would you guide me in obtaining info on this. Not that I don't like my call sign, KB6DYT, I might enjoy a change. I am also licensed for GMARS (what a lot of static in Los Angeles, most people don't bother to pay the fee).
I would appreciate any info.
Thanks from and old timer that wants to jump in again.
-Armando KB6DYT

4026. VK2KFU's List of Notable Amateurs

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-29 00:00:00 UTC
From: dave@eram.esi.com.au
Message-ID: <52lmva$dk0@eram.esi.com.au>
Source record: 215828
Cross-posted to: rec.radio.info,aus.radio.amateur.misc,rec.radio.amateur.misc

VK2KFU's List of Notable Amateurs

Have you worked any of these?

Now on the Web! See my list's Web page (courtesy WIA NSW) under:
"http://sydney.dialix.oz.au/~wiansw/lona.html". Because it's now in
HTML, the format may have changed; expect a number of spurious "diffs".

This is a list of the "notable" Amateur callsigns that I have been
gathering since 1992. I would appreciate any updates; send them to
dave@fgh.oz.au. Of course, "notable" is purely in the eye of the beholder;
I consider it as someone in the (non-Amateur) public eye. As an aside,
I suppose I should mention that I hate the word "ham"; I prefer "Amateur"
instead.

Another way of putting it is: "Did you know that XXX is/was an Amateur?"
when explaining to someone what Amateur radio is all about. Thus, people
like Monk Apollo would be regarded as notable (who would think that a
monk would be an Amateur, although few people outside of the Amateur
community would have heard of him); or somebody in the public eye not
suspected of being an Amateur. Note that I have deliberately left out
the current crop of Astronauts, as an Amateur ticket doesn't seem to be
a novelty any more (now it seems to be a requirement); instead, I will
mention the first from each country in space.

These calls have been gleaned from various places: amateur magazines,
USENET postings, and straight-out rumour... It is probably out of date,
and most likely contains errors; however, over time it should develop
into an accurate list, suitable for PR purposes.

Please note that I have no way of authenticating most of these entries;
many seem to have been obtained by trawling the callbook server for
likely names (and subseqently excised). If you do this, then please
double-check the entry; for example, I don't know the actor Andy Griffith
from a bar of soap, but I'm told he's in his 60s (unless he's pushing
up daisies) so he can't be the one in the callbook.

Following some criticism from someone who shall, for the moment, remain
nameless, I'd like to say that this list is as accurate as the submissions
I receive; if someone sends me a "duff" entry, I will accept it in good
faith, so don't send me entries unless you know they are OK, OK?

This compilation is Copyright (C) Dave Horsfall VK2KFU, 1992-1996.
Reproduction in part or whole permitted if the source is acknowledged.
Feel free to link to <A HREF="http://sydney.dialix.oz.au/~wiansw/lona.html">
VK2KFU's List of Notable Amateurs</A> but please let me know if you did.

Thanks to all who contributed - I tried to acknowledge each one. Special thanks to "The Canadian Amateur" and Jim W6CF for many contributions.

Also thanks to Jan-Martin Hertzsch for the info on RAEM, and Piotr Ochwal SP9TNM, for the info on the martyr SP3RN.

VK4HH Norman Hurll (was VK2BC), inventor
VK5AX Alf Traeger, inventor of the pedal wireless (SK)
VK5NIV Ivan Venning, Australian MP
VK6TP/G3KDH Tommy Price, speedway rider of Wembley fame
VR6TC Tom Christian, great*3-grandson of Fletcher Christian
VU2RG Rajiv Gandhi, former Prime Minister of India (SK)
VU2SON Sonia Gandhi, XYL of VU2RG
W0CXX Arthur Collins, founder of Collins Radio (SK)
W0EHR Marguerite Beneke, wife of Tex Beneke K0HWY
W0ORE Tony England, astronaut
W2SKE Bill Leonard, former President of CBS News (SK)
W2TDY Julius Baker, first flautist NY Philharmonic Orchestra
W2TQ Joel Miller, IEEE lawyer
W2ZGU John Campbell, editor of "Analog" (SK)
W3ACE Armin Meyer, former US Ambassador to Japan
W3GYH John F. Clark, former director Goddard Space Flight Center
W3NOD Jacob Beser, electronics specialist on "Enola Gay"
W4WRO Emory Gordy Jr, record producer and OM of Patty Loveless KD4WUJ
W4ZG Worth Gruelle, started "Raggedy Ann and Andy"
W5LFL Owen Garriot, astronaut
W6AQ Dave Bell, film producer and Academy Award winner
W6EZV General Curtis "Iron-Ass" LeMay, introduced SSB to USAF SAC (SK)
W6JKV James Treybig, CEO of Tandem and 6m pioneer
W6NRM Robert Weitbrietch(?), physicist, developer of TTY for deaf (SK)
W6OBB Art Bell, talk radio host
W6QHS David Leeson, Chairman and Pres. of California Microware (ret)
W6QYI Roger Cardinal Mahony, Los Angeles ("Trinity" on autopatch)
W6UK Alvino Rey, musician/bandleader
W6ZH Herbert "Pete" Hoover III, grandson of US Pres (call re-issued)
W8JK John Kraus, radio astronomer
WA2MKI Larry Ferrari, organ player
WA4CZD Chet Atkins, guitar player
WA4SIR Ron Parise, astronaut
WA6MOS Joseph Pevney, former Star Trek director, actor, singer
WA6TJM ?, President of ISD Inc (makes voice recorder chips)
WB4KCG Ronnie Milsap, singer
WB6ACU Joe Walsh, rock musician (James Gang and The Eagles)
WB6RER Andy Devine, cowboy actor (SK)
WV6VLY/WA6BND Steve Wozniak, co-founder of Apple (lapsed)
YN1AS General Anastasio Somoza, former President of Nicaragua (SK)
ZK1AN Sir Thomas Davis, former Premier of Cook Islands
ZL4HL Prof. Sir Horace Smirk, Founding Prof. of Wellcome Institute

Suspected or callsign unknown:

Freeman Gosden, actor (SK)
"Some royalty of the Netherlands"
James Hardie (Aussie entrepreneur)
Stan Gadsen (ditto)
John Button, Australian senator
Merville Shavelson (W6?), Hollywood director
Roc Kirby VK3???, chairman Village Roadshow Corp
Dale Buggins, motorcycle stunt rider (SK)
Fred Gwynn ("Herman Munster") (SK)
Violinist of LA Philharmonic (or is this W2TDY?)
Dr. Russell Hulse, co-shared Nobel Prize with K1JT (lapsed)
Elke Sommer's husband (she was allegedly seen on SSTV)
Edwin Armstrong, inventor of FM, superhet etc (SK)
Very Rev Dr John Flynn OBE, founder of Flying Doctor (SK)
James Clark, founder and chairman of Silicon Graphics
Clive Robertson, Australian radio host
Dr Amar Bose (Bose Audio)
Cliff Arquette aka Charlie Weaver, appeared on Jack Parr TV
Shaquille "Shack" O'Neal, NBA star (uses "Bill" when on air)
I. I. Rabi, Nobel Prize Winner
Founder of Hallicrafters Radio (SK)
Crown Prince Albert of Monaco
Someone on the Kon-Tiki expedition?

Disputed (some say yes, some say no):

Neil Armstrong, astronaut (but see Edwin)
Richard Feynman, scientist (SK)
Samuel F.B. Morse III, W6FZZ, grandson? (SK)
K2ZCZ, George Patacki, Governor of New York
KC4OCA, Gordon Barnes, weatherman
N6YOS, Priscilla Presley (Lou Lou Beaulieu), actress, Elvis' widow
W2JOF, Cliff Richard (Harry Webb), singer

Never licensed (but rumours circulate):

Bernard Goetz (of subway fame)
Jon Bon Jovi (but see KX2Z)
Jose Feliciano
Andy Griffith (he and Jose are in the callbook; it's not them)
Jimmy Stewart, actor and USAF flag reserve officer
HRH Prince Phillip the Duke of Edinburgh, patron of RSGB
Gary Shandling, comedian (callbook is incorrect for KD6OY)
David Letterman (he's not in the book, but is an SWL)
Tony Hancock, "The Radio Ham" (decd.)

>73, Cecil, W6RCA

Cecil, I fixed big, ugly, broken computers for 22 years. Should I have gotten a free Extra Class ticket, or is a college degree required to bypass the code test ? Carl is driving people nuts. Should he still have to take a test for a drivers license or should the the DMV grandfather him in ? I have a friend who has spent half his life in the hospital, he's had every kind of surgery you can imagine. Maybe the AMA should make him a doctor of medicine, huh ?
Is your log periodic working yet ? I'm ready to work some stateside DEEE-X.

>>The point is that CW is a very *popular* means of communication.

>Doesn't matter one damned bit!!! Popularity does NOT make it a
>legitimate licensing requirement.

That is correct. The FCC made it a licensing requirement, not popularity.

>>I suspect that it's popular because it's fun to use, and
>>it's still an *effective* means of communication.

>To *YOU* ... not to me, nor to many others ...

Oh well. Some people like sky diving and some people don't.

>>Thousands of hams throughout the world enjoy conversing in a "language"

>It's NOT a F___ing language!!! It's ONLY an old, inefficient means of
>encoding text into on/off keyed signals. NOTHING MORE ...

Sure it is a F____ing language. But only to those of us who *understand*
it..... Chinese is a language to people in China, but not to me. To me, it's
just noise. Sounds like geese F___ing. But to them, it's a language.
But we can't make all the Chinese people in the world speak English just
because I don't understand Chinese, can we Carl ? And we can't make
all the hams in the world stop taking CW tests and using CW just because you
don't understand dits and dahs......

>>It's a skill obtained through many hours of intense concentration and
>>practice.

>Many of us have better things to do with our time and energy than to
>waste it on something that we have NO intention of EVER using, just to
>please you and your associates that you've successfully forced us to
>jump through your stupid hoop like some damned dog!

Well, then go do them. You are not being forced to jump thru any hoops.
We are perfectly content for you to stay on 2 meters. We have plenty of
other people to talk to on HF. Hoop jumping is not mandatory. It's optional.

>Remember ... just because *you* like it does not a valid licensing
>requirement make ... not even if the majority of hams like it ... which
>is highly dubious ... I don't and I know many, many who don't ...

And I know many who do. But they are just as irrelevant to the testing
requirements as those you know who don't. Doesn't matter who likes
it or doesn't like it, as long as the FCC thinks we need to take CW tests,

those of us who want to get on HF will continue to take them.

That's just the way it is. It's da rules.

Hi Bill,

Thanks for the reply. I understand the flexibility requirements for administering the 5 wpm test to handicapped persons. This fellow had passed the 5 wpm test years ago, with no accomodation requested or needed, and had made no attempts for 13 or 20 thereafter.

Also heard a Tech Plus on a local repeater yesterday bragging (that was clearly his tone) that he was going to "get around" the code requirement forg General and Extra by getting his doctor to fill out the waiver based on him having Attention Deficit Disorder.

EMERGENCY FUNDING

The following is an important closed circuit advisory. Attention all
bulletin stations. Newsline is once again on the verge of bankruptcy and
existing hand to mouth. We urgently need your support to survive.
As we have said many times, the decision whether Newsline stays or goes
is yours. If you want this service to continue, we will need your ongoing
financial support, and it is needed right now.
The address for the Newsline Support Fund is:

NEWSLINE
P.O.Box 660937
Arcadia, California
91066

This ends the closed circuit with Newsline report number 998 for release
on Friday, September 27th, 1996 to follow.

(*****
The following is a QST

FCC recognition of repeater coordination comes one small step closer to
reality. The details on Newsline report number 998 coming your way right
now!

(*****
NATIONAL COORDINATION

Uniform frequency coordination of repeaters and recognition of
coordination by the Federal Communications Commission may yet be a reality.
A tentative agreement on the formation of a national frequency coordination
office has been worked out between the nations repeater coordinators and
the FCC.

Unified standards and guidelines for coordinating amateur radio repeaters in the United States, its territories and possessions could be a major step closer to reality because of a tentative agreement reached September 13th.

The American Radio Relay League and the National Frequency Coordinators Council have agreed on the wording for a Memorandum of Understanding between both groups.

The agreement stems from a meeting between the Council's Board of Directors and the League's Ad-Hoc Repeater Committee. The meeting took place at the ARRL's National Convention in Peoria, Illinois. Under the agreement, a new National Frequency Coordinator's Office will be established. The office will maintain a national database for all matters affecting repeater coordination.

The new office take a heavy role in coordination matters. It will serve as a communications liaison, or single point of contact between the Council and the FCC. It will act as a repository for information about standards and procedures for frequency coordinators throughout the U.S. and will contain procedures for resolving coordination and interference disputes involving amateur repeaters. The Office will also oversee identification, certification and de-certification of frequency coordinators, this, based on standards to be developed by the Council.

The Council is already made up of the nation's currently recognized repeater coordinators. It will develop and recommend for adoption what the Council calls fair and equitable procedures for frequency coordination.

The Council will also gather and supply data to the League about band occupancy and usage, this, reportedly as part of an effort to make sure that listed radio systems really exist and are not simply paper repeaters.

The agreement calls for the ARRL to recognize the Council's independence and to provide what's called suitable resources and support to the Council.

The League would also provide radio amateurs with information on how to contact frequency coordinators certified by the Council.

The Agreement calls on both groups to use their resources to achieve common goals, especially on issues involving amateur regulatory, technical or operating policies.

But there are unaddressed issues, too. For hams who operate or put up repeaters, the Agreement seems to mean little. The Memorandum of Understanding makes no mention of repeater users or other non-relay spectrum users. Do these hams or others have any rights about decisions on who can put a repeater on the air and who will not? The Memorandum doesn't say. Nor is there mention of protecting existing repeater operating policies or assurances for new repeaters trying to get on the air.

The Frequency Coordinator's Office can't be created until the League's Board of Directors approves the Memorandum of Understanding. Whether that will happen is not guaranteed.

The League's Board meets in mid-October. Until then, as an amateur, about the only you can have a say in adoption of this sweeping new set of rules about repeater coordination is by contacting your Division Director.

Almost a year has passed since a League sponsored frequency coordinators meeting in Missouri. What would happen in the wake of that meeting was pure speculation. What will happen next now that the League and the

Frequency Coordinators Council have reached tentative agreement is equally uncertain.
The next step is up to the ARRL Board of Directors. They will meet and discuss the tentative agreement in a few weeks.

HAM MAG STOPS ANTI HAM LAW IN WASHINGTON STATE

A proposed law governing the operation of mobile radio equipment in Washington State will not impact on ham radio. This, thanks to some quick action on the part of a ham radio publisher who listened to his readers. Ham Radio Online is an internet based ham radio magazine. Earlier this month its publisher Ed Mitchell, KF7VY learned that the Washington State Patrol was considering a new law governing the installation of all wireless devices in automobiles registered or operated in that state.
If passed as written, the new law would have limited all mobile wireless systems to hands free operation only. In other words, no hand mics of the type that most hams use. Even more ominous, all communication systems put into any vehicle would have to be approved by the Washington State Patrol equipment review unit.

"Some of the things that we saw was that the wording was very broad and very vague and would potentially impact far more people than we suspected that was their goal." KF7VY

The restrictive measure was to be considered at an October 9th public hearing in Olympia. On learning of the tentative new regulations Mitchell contacted both the State Patrol and Washington State Representative Brian Thomas.

"What we pointed out to them was that, as written, it was going to cover even such things as carrying a pager in your automobile. And we really didn't see how the state patrol had the expertise to certify all forms of mobile radio installations. It really seemed like an un-necessary burden." KF7VY

On September 17th, Thomas responded. He told Mitchell that he had spoken with Washington State Patrol Captain Tim Ericson. That they had concluded the proposed law was poorly worded. Mitchell also learned that the October 9th hearing was canceled and the State Patrol would start over on a new proposal.
On Friday, September 20th, Captain Ericson informed Mitchell that the purpose of the proposed law was only to restrict earpieces to covering one ear only, with a particular emphasis on cellular radiophone systems. In other words, to prohibit the use of dual earphones while driving.
Mitchell tells Newsline that as the result of the inquiry by Ham Radio Online, the State Patrol has proposed new wording for the rule. Wording that covers only these earphones and cellular telephones.
KF7VY says that no new hearing date has been set but he believes the revised wording is appropriate. As such, it is no longer a source of concern to the Amateur Radio community of Washington State.
Mitchell also thanks the hams who brought the matter to his attention,

and who worked toward affecting the wording change.

(*****
ARRL REQUESTS RF EXPOSURE RECONSIDERATION

The American Radio Relay League is saying no to new and more stringent
RF exposure rules as they affect hams. The ARRL has asked the FCC to
reconsider and reverse certain portions of the Report and Order on FCC
Docket 96-326. The August 1st Report and Order amended various Commission
rules to adopt new guidelines and methods for evaluating the environmental
effects of radio frequency radiation from FCC regulated transmitters.
But in its reconsideration request, the League asserts that the rules
enacted in the Report and Order were adopted through flawed procedures.
That in certain respects they are arbitrary and capricious.
Further, the League says that the Commission unreasonably and
arbitrarily refused to preempt certain state and local RF exposure
regulation of amateur stations. In other words, the Commission did not
adequately address the propriety of preemption of State and local RF
exposure regulations or land use decisions based on RF exposure concerns.
Local regulations that the ARRL says might arbitrarily restrict the ability
of Commission licensed communications facilities to provide service.
The ARRL also contends that the FCC failed to consider the impact of its
new rules on certain small business entities, including the League.

ON-LINE VANITY CALL SIGN FORM AVAILABLE

Gate 2 of the Vanity Call Sign program opened on Monday September 23rd
and an electronic version of the Amateur Station Vanity Call Sign Request
Form 610V became available from the FCC via the internet on that date.
Those wanting a copy can access the form on the Internet at the Federal
Communications Commission Wireless Telecommunications Bureau home page at:

www.fcc.gov/wtb

Then look under Amateur Radio-Interactive Vanity Call Sign. Detailed
filing instructions are available by clicking on the item number on the
Internet form.
There is however one caveat. That is electronic payment of the vanity
filing fee is not yet available. The FCC says that applicants must print
out and mail a completed FCC Form 159 with payment to:

Federal Communications Commission
Box 358994
Pittsburgh, PA 15259-5994

Please note that this is a different Post Office box and ZIP code than
for vanity requests and payments using FCC printed from 610 V.
Meantime all inquiries concerning Amateur Vanity call sign requests and
the filing procedures should be directed to the Wireless Telecommunications
Bureau's Consumer Assistance Branch in Gettysburg, Pennsylvania. Its'
toll-free telephone number is

(800) 322-1117

(*****
HARRIS TO HEAD ADVISORY COMMITTEE

Former FCC International Affairs Bureau Chief Scott Blake Harris has
been tagged to head up the Commission's advisory committee in preparation
for the 1997 World Radiocommunications Conference slated for Geneva
Switzerland. Harris is currently a partner in the communications law firm
of Gibson, Dunn and Crutcher in Washington, D.C.

(*****
LUCID COMES HOME

Astronaut Shannon Lucid has come home after setting a new American
record for time spent in orbit that included ham radio.

After six months in space, Shannon Lucid is back on earth. But it may
be weeks before she is back to normal. She will have to learn how to walk
all over again, getting used to the effects of gravity.
During re-entry, she rode in a special seat, the "recumbent seat" they
call it. Its on the mid deck so that she could remain supine, flat on her
back after landing so that scientists could examine her before she started
working against gravity.
Shannon used ham radio to stay in touch with the folks back home during
all those months aboard the MIR space station. She had been to busy to get
an Amateur license before she took off, so the Russians made special
arrangement that allowed her to operate as R0MIR under the supervision of
her ham radio Cosmonaut companions.
Her unorthodox technique on the air elicited plenty of comment among the
Amateur fraternity, but she did operate, and managed a few general QSO's in
the process. These are valid for QSL cards if you were lucky enough to
work her.
Now, John Blaha, KC5TZQ, has taken Shannons place aboard the MIR and
John is an avid ham. Indeed, he even used the space shuttle radio to make a
few contacts on the way up to orbit! He has been exercising the MIR ham
radio station ever since the MIR and the space shuttle separated. You can
look for him on 145.55 MHZ simplex when MIR is in range. Check the AMSAT
BBS for the best times. John will be on MIR for the next four months.
Incidentally, to accommodate both spacecraft, a special frequency of
145.84 MHZ was set up for the shuttle downlink while MIR operated the usual
manned space flight channel of 145,55 MHZ. While the two spacecraft were
docked, Jay Apt, N5QWL, checked out the MIR radio station and made a few
contacts. Jay and team mate Carl Walz, KC5TIE, also used the shuttles'
SAREX equipment and were very active throughout the mission.
Some excellent pictures of all of these hams working their stations have
been released by NASA. They were shot using an electronic still store
camera and can be found in the "NASA Images" files on the internet.
SAREX, of course, arranges for shuttle astronauts to talk to students
and some successful contacts were reported with the Andover Middle School
in Kansas, the Immaculate Conception Elementary School in Celena, Ohio and
the Royal School for Girls at Haslemere, Surrey, England.
It's another success story all the way for Amateur Radio in space.

Shannon Lucid's ham radio operation from Mir has gotten the hobby far more positive public exposure than that of any other astronaut since Owen Garriott made the first ham radio in space flight on STS-9. There have been radio, television and magazine profiles of her. Most have included coverage of her amateur radio contacts from Mir. It's ironic that this great publicity has been generated by a non-ham operating from a foreign spacecraft on operating and special waiver of the Russian Amateur Radio rules.

(*****
AO-13 RE-ENTRY

Amsat Oscar 13 will probably self destruct the end of November. This, according to PY5BYE who says AO-13 will re-enter the earths atmosphere and burn up at about 11:42 UTC on November the 30th. PY5BYE says that he bases the projected demise of AO-13 on scientific data that includes combined effects of Earth's oblateness, atmosphere flattening and rotation and random variation in atmospheric density. At this moment Atmospheric drag is the principal orbital perturbation for the dying satellite.

(*****
HAMDI-HAM NELP WANTED

The Handi-Ham System needs some volunteers to assist with two camping events in 1997.

Handi-Hams is looking for you. Amateur participants and instructors are needed for upcoming Handi-Ham camps.
Two amateur training camps are held each year. The summer camp is held in Golden Valley, Minnesota, while the winter camp is held in Malibu, California.
If you are interested, in working toward your amateur license or wish to volunteer as an instructor contact:

Handi-Hams
3915 Golden Valley Road
Golden Valley, Minnesota
55422

EMERGENCY SERVICES CONFERENCE

The Douglas County Kansas Radio Amateur Civil Emergency Service will host a two day Auxiliary Communications Workshop in early October. The featured speaker will be Stan Harter, KH6GBX who is Assistant Chief of the Telecommunications Division of California's State Office of Emergency Services.
The session is titled "Communications Volunteers in Government Service. It takes place October 4th and 5th at the Lawrence Memorial Hospital in Lawrence, Kansas, about forty miles west of Kansas City International Airport.
The workshop is free but all participants are required to pre-register. To do so contact either N0AP or N6YR at their callbook address if you plan to attend.

(*****
VERN RIPORTELLA, WA2LQQ, SK

It is with deep personal sorrow that we report the passing of one of the nations and the worlds best known radio amateurs. Former AMSAT North America president Vernard "Rip" Riportella, WA2LQQ, of Warwick, New York, died suddenly on September 13th of an apparent heart attack.
Rip was a former U.S. Air Force officer before becoming the third president of the North American AMSAT group. He served in that position from 1984 until 1987, and is generally credited with being a prime mover behind the development and launch of OSCAR satellites 10 and 13.
In the early 1980's, Riportella was involved in gaining AMSAT's backing in the then very new Shuttle Amateur Radio Experiment or SAREX program. He also appeared in the 1987 video "The New World of Amateur Radio" to explain the ham radio space program.
Rip also served a stint as the editor of QST's "Amateur Satellite Communications" column and wrote several articles for QST on satellite communication. He was the creator of the AMSAT Satellite Report newsletter and as longtime listeners know, Rip was a frequent contributor to Newsline.
In more recent days, Rip, who was only age 52 at the time of his death, had been involved in upgrading the packet radio equipment aboard the Russian Mir space station. He was also working quietly at building tighter bonds between the various ham radio space related groups worldwide.
Most important of all, Vern Riportella, WA2LQQ, was a truly close friend for the better part of two decades. His contributions to Amateur Radio and the Amateur Radio Space Program will be long remembered, and we will all miss him very much.
Condolences may be sent to Rip's family at:

P.O.Box 177
Warwick, New York
10990

>you have any questions email me.

I went to your web page and saw the so called "Freeware" program you
were talking about. It is not freeware so don't call it that. You are
passing what is called "Crippleware". Freeware is something that has
all features enabled and the author does not charge anything at all
for it's use. You are charging $10 to unlock some features. All you
are doing is trying to get suckers to come to your page and download
your file and then get $10 from them. I didn't even bother to download
your file after I saw that it was not actually freeware but
crippleware. I hope everyone else will see it that way to. Besides if
you have an internet account you can get all those same calls for free
anyways.

>widespread use in the amateur service packs the most QSOs per kHz? You've
>had a week to support your supposaid "fact" with some numbers, but have
>failed to do so.
>

First, I said NOTHING about "in widespread use in the amateur radio service" ... I've already said that ham technology is inefficient and backward and needs to be updated significantly to catch up to today's world ... however, with that said, practically *every* other mode in use in the ham bands is more spectrally efficient than OOK Morse ...

The issue is not QSOs per kHz ... that outdated concept panders to the idea that "narrower is better" and ignores the existence of time. The way to measure the spectral efficiency of a modulation scheme is with a metric like "bits/sec/Hz" ... this sort of metric recognizes the well-known engineering fact that the absolute bandwidth is totally irrelevant to efficiency. There have been many examples presented here in the past weeks that clearly show, by simple math, that virtually *every* other mode (except spark) is more spectrally-efficient than OOK Morse, so rather wasting the effort in regurgitating them, I'll refer you to DejaNews or AltaVista ... (assuming you *really* want to see them again, which is dubious ...)

>> Dollars are not the relevant figure of merit ... it's an equation like:
>
>Outside of academia, dollars are *the* figure of merit. Ham Radio purchases
>are *very* cost sensitive. To claim that you don't care what it costs
>smacks of elitism.

In your zeal to refute my assertions, you fail to take the time to read them and attempt to understand what they mean ... I NEVER said "I don't care what it costs." In fact, I have stated numberous times here that there is no inherent reason that, in widespread use, the newer technologies that folks like Phil Karn, Gary Coffman, and others (and I) are advocating should cost more than today's backward technology ... in fact, the liklihood is that the use of newer technology will result in

cheaper implementations (with better performance) than the triple and quadruple conversion "super"het monstrosities that are being foisted on hams today as "the latest in technology" ... (what rubbish!!!)

>
>> (value_of_activity*number_of_users)/(spectral_efficiency)
>
>Buried in this equation is a very dangerous idea: that some QSOs are more
>valuable than others, an idea wholly repugnant to the First Amendment.
>After all, who can make such a judgement?

The FCC WILL make EXACTLY that judgement when deciding to take our bands away and auction them off to some deep-pockets commercial enterprise who proposes to use them to provide valuable, desirable services to *millions* of users. (it's called "the public interest")

They'll look at our bands and the comparative lack of activity therein and the backward, inefficent technologies that we're using and say:

"Let's see now ... over here we have a small number of these 'hams,' occupying many, many megahertz and clinging to the past with their insistence on, of all things, Morse code and the like in today's world (can you *believe* that?)"

"Our choice is clear ... hams, out ... commercial service in ... we get many tens of billions of dollars in license fees to reduce the national debt and the people of America reclaim a wasted resource to provide benefits to far more people than those paultry few 'hams' ... besides, those 'hams' are so far back in the 'dark ages' that they're of no practical use in emergencies any more ... and they're certainly not contributing to the advancement of technology like they *used* to ..."

"So ORDERED .."

>A more objective figure of merit would be:
>
>(# of QSOs)**2 / (Hz) * (Total Equipment Cost)
>

The above is totally irrelevant to the regulators ... and the "formula" makes ZERO sense ...

>Incidentally, the efficiencies available to VHF+ Spread Spectrum don't
>translate to HF. For starters, the available chip rate is much, much lower,
>given the scarcity of spectrum. For another, it's extremely difficult to get
>orthogonality in a Rayleigh fading environment. The only practical and
>longterm use of spread spectrum on HF has been radiolocation, and it works
>quite well, given the relatively low information rate and lack of reuse.
>

The above paragraph shows clearly that you have ABSOLUTELY NO IDEA of
how spread spectrum could be (and has been) applied to HF.

>> I'm saying that the RULES are not in keeping with the times and do not
>> promote technical progress in ham radio, but rather they look to the
>> past.
>
>So what you're advocating is not only the elimiation of the CW exams, but of
>HF SSB as well? After all, you've pointed out repeatedly that these kinds of
>changes have had to be forced onto land mobile.
>

I never said "ban CW" ... nor "ban SSB" ... all I've said is:

1) "Eliminate the CW test .. it's outlived any usefullness it
may once have had."

2) "Make the written exam meaningful."

3) "Change the rules to remove artificial, ill-advised barriers
to the introduction of new technologies."

>What you are therefore advocating is a change from a system that works to
>one whose technology doesn't even exist, will outlaw all existing equipment
>(thereby making it worthless), and will require more capital outlay from every
>single user.

Again, in your zeal to refute my assertions, you fail to comprehend (or
choose to ignore) what I said ...

I never said "outlaw (any) existing equipment" ... I never said "ban the
use of (any) mode" ...

And I'm not talking "pipe dreams" about "technology that doesn't even
exist" ... I'm talking about technology that's being used every day by
commercial users ... hell, even *consumer devices* like cordless phones
and cellphones ... WAKE UP!!!

>And for what reason? Why should we all pay more for a system
>that will, in all likelihood, be about as efficent as the current system?

RED HERRING ALERT!!!!!!!!!!!! The above statement is deliberately
designed to decieve the reader through deliberate missrepresentation of
facts and obfuscation ...

ANYTHING (other than spark or two tin cans and some string) would be
more efficient that our current "system" ... there IS NO "system" ...
just a random collection of largely antiquated garbage ...

It doesn't confuse me it just isn't proper English. You know perfectly well the only time I, and others, complained to your ISP was when you were being totally irresponsible trying to make some obscure point. While on that subject, then official text for EMTs still considers blood as the primary risk for AIDS exposure. You have got to straighten them out.

You know you could get a commercial ISP rather than bringing your employer to the table with every stupid post you make. You know like your annoying habit of calling people with whom you disagree liars. If you slander someone in a public forum then I think they have a perfect right to complain to your ISP. If you post from your employer's system then that is on your head.

>After all, who can make such a judgement?

The FCC has alreaddy limited your first amendment rights by limiting
QSOs to non-commercial traffic. (i.e. you can't conduct business
with an amateur QSO... first amendment violation? you tell us)

>(# of QSOs)**2 / (Hz) * (Total Equipment Cost)

I side with Carl that cost is not relavent. Also, if you want to make
it a test as opposed to a random survey of spctrum, then it is
easy to move far more QSO's via packet than any equivalent
number of CW QSOs that might fit into the bandwidth the packet
signal occupied.

>> Besides, the newer techologies are not inherently more expensive than
>> the fancy "narrow band FM" radios you mention in the following

>Okay, so where are they? There's no "code blockage" on VHF technology, and
>everyone new is going straight to the wideband technology. Why shouldn't
>we expect the same to happen with HF?

Because there just isn't as much HF spectrum Isn't that
obvious. Many pro-code pundits keep pointing out
that VHF and above is 99% greater frequency spectrum than
HF (1%).

>> I'm saying that the RULES are not in keeping with the times and do not

If newer phone techniques ultimately lead to the
elimination of SSB, so what. But, once again, elimination

of any test element does NOT equal elimination of any
mode.

>What you are therefore advocating is a change from a system that works to
>one whose technology doesn't even exist, will outlaw all existing equipment

>The technical "facts" you've presented do not support your position, and the
>empirical facts from 5+ years of the codefree tech disprove it.

Carl's opinion of what might be is his. The real issue once again
is for the government to justify why anyone in 1996 should be
forced to learn CW, a mode that has no support outside the
amateur spectrum. That statement is made with full recognition
and emphasis that while some hams love CW, will continue to
use CW, and should be allowed to continue using CW, that
all hams gaining access in the future need not learn CW. There's
just no qualitative or objective argument today to sustain
continued CW testing into the 21st Century.

Did you read the material you were responding to? ASA specifically
permitted them, and Delta specifically mentioned they had to be off only
during the low altitude, taxi, etc., phases which rather implies they
are allowed otherwise. If there is one thing that characterizes US
carriers' policies in this area, it is a *lack* of consistency other
than requiring that PEDs be turned off below 10,000 feet.

Have you determined that of the 44% who told the ARRL that they never use Morse, how many were HF operators, having had to pass the 13 and 20 wpm requirements? If this survey sampled the total ham population would not those who had a no code license be likely to say they had never used Morse? One would think that, to emphasize your point, you should have taken the poll results of ARS HF operators only for their response to the question.

In addition you suggest that "Dx gaming" forces some to grudgingly use Morse. I would suggest that DXing is attracted to the reliability of CW to make long distance contacts on HF, not that other skills are not required. Thus, it is this attribute of CW that makes it attractive to DXers.

Bill,
To net it out, I could have sent a .37 stamped envelope and received better
service than the $10.75 for 'special handling' with 'specific instructions'. At least
another government agency wouldn't have to defend the actions taken by
their contracted vendors, or their inability to manage the process.

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 29/2330Z SEPTEMBER 1996 BY IPS RADIO AND SPACE SERVICES
FROM THE AUSTRALIAN SPACE FORECAST CENTRE
SUMMARY FOR 29 SEPTEMBER AND FORECAST FOR 30 SEPTEMBER - 02 OCTOBER

1A. SOLAR SUMMARY
Activity: Very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 70/5

GOES satellite data for 28 Sep
Daily Proton Fluence >1 MeV: 2.3E+06
Daily Proton Fluence >10 MeV: 1.8E+04
Daily Electron Fluence >2 MeV: 3.4E+08 (moderate)
X-ray background: A2.1
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
30 Sep 01 Oct 02 Oct
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 30 Sep: 70/5

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: Quiet to unsettled

Estimated Indices : A K Observed A Index 28 Sep
Learmonth 8 2322 2222
Fredericksburg 10 19
Planetary 13 17

Observed Kp for 28 Sep: 1552 3321

2B. MAGNETIC FORECAST
Date Ap Conditions
30 Sep 15 Unsettled
01 Oct 30 Active to minor storm
02 Oct 15 Unsettled to active
COMMENT: IPS Geomagnetic Warning 11 was issued on 28 September
and is current for interval 30 September to 1 October. Disturbance
expected to begin during local night 30 September.

3A. GLOBAL HF PROPAGATION SUMMARY
Latitude Band
Date Low Middle High
29 Sep Normal Normal Normal
PCA Event : None

3B. GLOBAL HF PROPAGATION FORECAST
Latitude Band
Date Low Middle High
30 Sep Normal Normal Fair
01 Oct Fair Poor Poor
02 Oct Normal Normal Fair
COMMENT: HF conditions at mid-high latitudes are expected to
become degraded on 1 October in association with expected geomagnetic
activity.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Date T index
29 Sep 1

Observed Australian Regional MUFs:
Darwin: No data.
Townsville, Sydney, Hobart: near predicted monthly values.

Predicted Monthly T index for September: 9

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
Date T index MUFs
30 Sep 5 near predicted monthly values
01 Oct -10 10 to 20% below predicted monthly values
02 Oct 5 near predicted monthly values
COMMENT: IPS HF Communications Warning 17 was issued on 28 September
and is current for interval 1 October only. Degraded HF conditions
expected from local night on 30 September to 1 October. Depressions
of 10 to 30% expected for southern region (mid to high latitudes),
Northern region (low latitudes) should continue to use monthly
T index of 9.

> in the ham bands is more spectrally efficient than OOK Morse ...

Okay, so you've granted me that your solution does not currently exist.
Okay, fine. Then any change can wait until your solution does exist, and
constitutes a practical replacement.

The reason that QSOs/Hz and not bits/Hz is the relevant metric is that human
beings adapt their information rates to the channel in question, applying
compression in various forms. Oddly enough, most of the stated goals of the
Amateur Service involve direct communications between human beings. Go out
on 20m sometime, and count the number of human QSOs versus automated links.

> The issue is not QSOs per kHz ... that outdated concept panders to the
> idea that "narrower is better" and ignores the existence of time.

Narrower in the Shannon sense will always be better. In the end, you still
have to pack a number of QSOs into the available bandwidth. Incidentally,
the "wider is better" myth fell out of favor about two years ago.

> The way to measure the spectral efficiency of a modulation scheme is with a
> metric like "bits/sec/Hz" ... this sort of metric recognizes the
> well-known engineering fact that the absolute bandwidth is totally
> irrelevant to efficiency.

That assumes that the information rate is independent of the channel rate,
which is false in this case. In the end, you still have to modulate
some kind of baseband information into the channel. If the baseband
information rate is lower, then you will inherently be able to pack more
users into the available bandwidth.

>There have been many examples presented here
> in the past weeks that clearly show, by simple math, that virtually
> *every* other mode (except spark) is more spectrally-efficient than OOK
> Morse, so rather wasting the effort in regurgitating them, I'll refer
> you to DejaNews or AltaVista ... (assuming you *really* want to see
> them again, which is dubious ...)

But again, those didn't use relevant metrics. The issue here is whether or
not the HF bands could handle more *users*, not more bps per Hertz.
From a bps/Hz perspective, you're correct. But since the user community is

rate adaptive, your comparison is irrelevant to the original question.

(It's also sort of funny being referred to my own creation, BTW.)

> In your zeal to refute my assertions, you fail to take the time to read
> them and attempt to understand what they mean ... I NEVER said "I don't
> care what it costs."

In article 52hs0t$gjk@news.ais.net, you write "Dollars are not the relevant figure of merit." Looks to me like you don't care.

> In fact, I have stated numberous times here that there is no inherent
> reason that, in widespread use, the newer technologies that folks like
> Phil Karn, Gary Coffman, and others (and I) are advocating should cost
> more than today's backward technology ...

So fine. Build them, and we'll believe you. The CW requirement isn't stopping anyone from building or deploying such a system. And, if it behaves in a manner that you describe, very few will object to seeing CW go the way of the dodo bird, least of all me.

Until that time, we have to deal with what we have. The claim that the CW requirement somehow is impeding progress has been proven false empirically by the the codefree tech at VHF+.

> The FCC WILL make EXACTLY that judgement when deciding to take our bands
> away and auction them off to some deep-pockets commercial enterprise who
> proposes to use them to provide valuable, desirable services to
> *millions* of users. (it's called "the public interest")

Agitprop. The HF bands are not in danger; witness the last full WARC in which we actually *gained* in HF. Everyone else is moving to satellite, largely because they can afford to.

>
> The above paragraph shows clearly that you have ABSOLUTELY NO IDEA of
> how spread spectrum could be (and has been) applied to HF.

Then you can prove that assertion, or discredit yourself.

> I never said "ban CW" ... nor "ban SSB" ... all I've said is:

Oh yes you have. You've repeately called for a mandated change from "outdated" technology to something new. You've said that price isn't a factor, so the marketplace won't support that change. With all of those existing modes raising the noise floor, your system won't have enough orthogonality to function at the level you've claimed. So you're going to have to do something.

> And I'm not talking "pipe dreams" about "technology that doesn't even
> exist" ... I'm talking about technology that's being used every day by
> commercial users ... hell, even *consumer devices* like cordless phones
> and cellphones ... WAKE UP!!!

Those devices have several hundred megaHertz to chip over. The largest HF ham band is a little over 1/100 of that size, and don't have to deal with ionospheric fading.

For that matter, what do you want with HF anyway? Industry has concluded that HF is "obsolete", and is moving to satellites. By your methodology, we should just give up HF cold turkey and go to satellites.

The simple truth of the matter is that the CW requirement isn't holding up progress (as evidenced at VHF+ by the codefree tech). Rather, the technology hasn't been properly adapted for the amateur service. Until that changes, the most efficient way to use the HF spectrum is to encourage the use of CW, which the requirement supports.

*** Mid Atlantic VHF Conference ***

The 20th Annual Mid-Atlantic States VHF Conference sponsored by the Mt. Airy VHF Radio Club will be held on Saturday, 5 October at the Days Inn in Horsham PA. Technical presentations relating to VHF/UHF/SHF weak signal operating will begin at 9AM.

The Days Inn is located just north of exit 27 (Willow Grove exit) of the PA Turnpike, north of Philadelphia, in Horsham, PA. Rooms at the Days Inn can be reserved by calling 215-674-2500. Mention Pack Rats for a discount. The Days Inn is filling up quickly, so reserve soon. Additional lodging is available in the Horsham area: Holiday Inn Trevose (215) 364-2000, Marriott Willow Grove (215) 830-0550, Hampton Inn Willow Grove (215) 659 - 3535, Warrington Inn (215) 343-0373.

*** HAMARAMA ***

On the following day, Sunday 6 Oct. the Packrats will have their annual hamfest at the Bucks County Drive In Theater, about 5 miles north of PA Tpk. exit 27 on Rte. 611. Talk-in on 146.52 simplex and the club repeater on 224.58.

Ron, WZ1V has placed the flyer for the events, including a preliminary list of presentations, on the N.E.W.S. Group web page:
http://uhavax.hartford.edu/~newsvhf/hamarama.html

For more information on the technical conference or a possible presentation slot, contact John Sortor, KB3XG, at 610-584-2489 or at JohnKB3XG@aol.com.

** Preliminary Conference Agenda **

SPEAKERS TOPICS

KD1DU, Del Schier - Introduction to 10 GHz Equipment and Operation

WB6JJN, Jim -Amateur Satellites:Modes, Bands,& Issues @ VHF thru Microwaves

AJ3K, Jim Rautio, Sonnet Software - 3-D Planer Electromagnetic Design

WA1YHO, Gary Dallas - Using YO & AO to Optimize a 6M Antenna System

N1DPM -Introduction to VHF/UHF Weak Signal Operating

Harvey Kaylie, Mini-Circuits Laboratories

WB2SON, Richard Fiore - American Technical Ceramics

W3ZZ, Gene Zimmerman - 40 Years of Contesting

Preliminary schedule of events:

Friday, October 4, 1996
5pm to 11pm - Out of town guests arrive, check in.
The 2 meeting rooms be used as a hospitality suite. The Pack Rats will provide snacks & beverages

Saturday, October 5, 1996

9am to 12pm Morning conference session.
12pm to 1pm Lunch break
1pm to 5pm Afternoon conference session.
5pm to 7pm Hospitality suite.
7pm to 9pm Dinner/Banquet
9pm to 11pm Hospitality suite.

Sunday, October 6, 1996

6am to 10am Check out
7am to 3pm Hamarama at the Bucks County Drive In

>
>Gary ... your point is (as usual) valid ... however, the CW folks
>continue to refuse to even consider switching ... in light of yout last
>sentence above this speaks volumes :-)

You're being overly harsh again. Today, there is no *need* to
switch. Numbers have not yet climbed to a level where a choice
must be made. Current HF enabled licensees have a large sunk
investment in Morse wetware conditioning. They are reluctant
to discard that while they can still get marginal utility
from it.

>>Susan Ness is correct. We can accomodate arbitrarily many
>>amateurs on HF if we use techniques better than the ones
>>we use now.
>
>I would suspect that the Hon. Ms. Ness only knows that because some
>engineer on her staff told her that, but at least SHE has the sense to
>believe good engineering advice ... that's a LOT more than can be said
>for significant numbers of today's licensed hams ...

While I do believe you are correct that Commissioner Ness is
a lawyer rather than an engineer, you must also realize that
she has a different objective, a different metric in mind,
when she looks at spectral usage than current amateur licensees
have. She is charged to maximize spectral value in the public
interest. Amateurs are primarily motivated to protect their
individual private interests. For the most part, that oftem
appears to them to be best served by defending the status quo
rather than embracing more spectrally efficient methods of
communicating.

Entrenched interests fear change because they aren't sure what
their place will be in the new order. Thus they tend to vigorously

defend the status quo. Only a relative handful see change as an opportunity rather than a threat.

You must consider that if we were to demonstrate that we could use our spectrum more efficiently, and if we then didn't have sufficient numbers to fully occupy it at that higher level, we'd risk losing some of the spectrum we have warehoused.

As long as the bands appear full, to the naive who don't know there are better ways to use them, they look safe. Unfortunately for the naive, the Commission appears to be discovering that there are more efficient ways of using spectrum.

If we want to keep the bands we have, it seems to me that we must first increase numbers to such an extent that amateurs will voluntarily adopt more efficient methods in order to cope. That keeps our spectral occupancy high while at the same time showing we're willing to use what we have to best effect. If we don't do this, we may find a Part 90 style solution imposed on us, and then find parts of our bands taken because we aren't occupying them fully.

Of course increasing our numbers has another benefit, the good old grassroots political kind that politicians understand very well. That's useful even if we don't voluntarily adopt more efficient techniques. Unfortunately, while that would likely defend our spectrum, we could get a bedlam like the current 27 MHz situation. That spectrum is as safe as can be, no politician would dare touch it, but it isn't of very high utility because they are locked into an inefficient technique by regulation. They cannot innovate, that's forbidden, and they can't even adopt the innovations of others, because that's forbidden too.

Perhaps I have more faith in amateurs than some of the code test proponents, because I believe we would embrace better techniques, rather than degenerate into a bedlam, if we grow the service. The amateur service has a history of innovation, and a record of being first adopters. In fact our regulations *encourage*, almost mandate, that we do so. Sometimes it seems we need a kick in the pants to do so, but I think our love of new gadgets will overcome our inertia if put to the test.

Worse, they say "TV News" on them. :-)

DTS is a separate entity, not connected with my broadcast work.
I don't post my broadcast affiliation because I don't want to
appear to speak for them. I speak for DTS since I own it outright.

>
>73, Jim KH2D

Not that long ago, "da rules" said "coloreds to the back of the bus".
"That's just the way it was." Sure, it was "optional", coloreds didn't have
to ride in the back of the bus. They could walk. But some people decided
that "da rules" weren't reasonable rules, so they agitated for change.
Eventually, change happened.

Note, I am not equating the code testing debate to the Civil Rights
struggle. The two issues are not parallel, nor of anywhere near equal
importance. All I'm trying to highlight here is the ideas of "that's
the way it is" and "it's da rules" is the same sort of thinking
applied by those having government force on their side at the time
in both cases.

I'd also caution that over-reaction can occur when large amounts
of pressure have to be brought to bear to reshape the rules. This
isn't good either, because one set of unreasonable rules often
get replaced by another set of unreasonable rules in the opposite
direction.

SB DX @ WW $OPDX.272
Ohio/Penn DX Bulletin No. 272

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 272
BID: $OPDX.272
September 30, 1996
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, WU1F, K3TEJ, N5OK, KK6EK, DK7NP, WD8SDL, YV5DTA/W4, DL5IAR, DL9GOA & DX News Letter, EI6FR, G4BUE & the DX News Sheet, LU9AUY, PS7AB, SM0BFJ and TF1MM following DX information.

4U, UNITED NATIONS HQ. 4U51UN (aka 4U1UN) was heard active on 20 meters CW and SSB. This special callsign will be used until the end of October to celebrate the 51st anniversary of the United Nations. QSL ONLY to WB8LFO.

5X, UGANDA. Leif, SM0BFJ, reports that Gus, 5X1D, is active every day between 1730-1800z on 50.150 MHz. He also states Gus is the first station ever to be active from Uganda on 6 meters. QSL 5X1D via SM0BFJ.

ARGENTINA BEACON. Mats, LU9AUY, reports having a part-time beacon (LU9AUY/BCN) active on 28197 kHz running on a TS-870 (10 watts) into a 3 element Cushcraft A3S Yagi at 30 meters. Mats leaves the beam pointed at Europe (somedays to Caribbean and the U.S.). The beacon is active on his weekday afternoons... (as he is working) ... then it goes QRT for normal operation. Mats hopes to receive any reports soon.

A5, BHUTAN. "The DX News Sheet" report A57A was reported on the UK DX Packet Cluster at 2209z, September 18th, on 7001 kHz giving his QSL manager as JH1AJT. There was speculation in 1995 that Zorro, JH1AJT, who was active from A5 in 1994, may be active later in the year.

A6, UNITED ARAB EMIRATES. Don, WB2DND will once again be active from here November 3-8th, from A61AD's QTH. Activity will be on all bands including 160 meters. Don has reportedly shipped a 1000 feet of wire to put up an inverted L and beverage aimed at Europe and North America.

BRYLA NET. BRYLA (PY-YLs Net), which started in July 1975, meets on Wednesdays on 14248 kHz from 1900-2100z. Interested operators gather together with the Brazilian YLs and DXers from around the world so they

can have a chance to make contacts to work for their BRYLA Award. Net controller has been Teresa, PT2TF, who has been sharing the frequency with Alzira/PT2LS, Helt/PY1AIP and Tessy/PS8YL.

C6, BAHAMAS (UPDATE). As reported in OPDX.271, John, K3TEJ, and Ed, WA3WSJ, will be in the Bahamas on Great Abaco Island. They will be there from November 19-26th, to operate CW and SSB on all bands (160-10 meters including WARC bands). During the CQWW CW Contest they will be using C6A/K3TEJ. QSL via K3TEJ.
Meanwhile, the DXNS reports that Mike, W7FKF, will be active October 22-28th, as W7FKF/C6A. Mike will also participate in the CQWW SSB Contest probably as C6AHU, 160-10 meters near the IOTA frequencies. QSL via WJ8C.

CY9, ST. PAUL ISLAND. Weather continues to plaque the CY9AOE operation. Don, VE1AOE, and Ken, VY2RU (VE1RU), orginally planned to leave September 18th for this operation.

FW, WALLIS & FUTUNA ISALNDS. DJ2EH DJ4OI and DL8NBH will be active between October 22nd and November 4th, signing FW/homecalls. Their QSL route will be announced later. They plan to be active on 160-10 meters CW, SSB and RTTY. There will be an emphasis on the WARC bands and the lowbands.

KC6, REP. OF BELAU. Members of the Oklahoma DX Association are returning to Belau. N5CG (KC6GG) and N5OK (KC6OK) will be arriving in Koror on the 12th of October. They will be operating all bands from 10 through 160 meters, including the WARC bands. Operation will be limited to CW and SSB with participation in the CQWW SSB Contest and possibly the CQWW CW Contest. Normal DX operating frequencies will be used. QSL to: Belau DXpedition, Box 88, Morris, OK 74445-0088.

OD, LEBANON. Thor, TF1MM, continues to be active as OD5/TF1MM from Naqoura, South Lebanon. This is the UN headquarters and he has been permitted to use a 16 element Log Periodic. He was heard on 14016 kHz at 1545z and 10103 kHz at 1950z. QSL via 4X4DX.

QSL NEWS AND UPDATES....
Declan, EI6FR, reports all direct QSL requests for the EJ7NET Blasket Island (EU-007, June 1996), which was activated by the WestNet DX Group, were mailed Tuesday morning (September 24th). Only a handful of cards were held because of requests for other operations. These will be answered before the end of the week. All bureau cards will now be made out to all those appearing in the Blasket logs....

Roder, WD8SDL, reports that the CY0AA QSL cards are at the printer. He is hopeful that the cards will be received from the printer in the next week, but whenever they arrive he will get them in the mail ASAP. Please hold off second QSLs until after the first of the year....

RS-12 SATELLITE DX (From WU1F). Joel, WU1F, located in Massachusetts (Grid Square FN42), reports the following stations worked on RS-12 Mode K: GW0DZL, G3KMQ, G3LUW, OZ1AED, VY2RU, V31DE, OZ8ABE, TI5RLI

and DF8TJ. "Looks like there IS DX around" ..... Joel WU1F.

VK0 HEARD ISLAND GATHERING (UPDATE). Bob, KK6EK, reports that the Heard Island team was gathering this past weekend in the San Francisco Bay Area for training and equipment checkout. Also, this was reported to be an open house for all who were interested in meeting the team and seeing one of the shelters that they would be using on Heard Island, complete with radio, computers, galley, and sleeping facilities. The gathering took place on Coast Guard Island, Oakland.
Meanwhile, this week an announcement of the addition of Arno Metzler, OE9AMJ, and Michael Mraz, N6MZ, to the Heard Island team was made. As of this moment the team is:

EA8AFJ Michel Sabatino NP4IW Carlos Nascimento
HB9AHL Willy Rusch OE9AMJ Arno Metzler
JH4RHF Junicho Tanaka ON6TT Peter Casier
KA6W Ted Algren PA3DUU Arie Nugteren

Those *sincerely* interested in doing research on HF don't need an amateur ticket (why would a professional want to be called an "amateur" anyway?). They can surely conduct any and all experiments off the air, and when an on-the-air test needs to be conducted any HF licensee can assist.

Remember, most aircraft designers are not pilots; in particular, those who design spacecraft are not astronauts. The designers of your HF IK&Y rigs aren't necessarily hams.

Maybe you should change your approach towards Williamson - tell him he'll eventually be rich and famous for his HF efforts; don't mention "amateur" radio - the good doctor must cringe at hearing that word.

>multiply and divide by hand using that heavy duty engineering equation.
>That's *real* tough.

Nope (I was tempted to use a d). Never mentioned Ohm. Never mentioned any particular formula. What I did say is that I'd like to see calculators banned during testing sessions. No "demand" was made. This would insure that the applicant can carry out approximations of roots and exponentiation, too - not just multiplication and division. In case you didn't know, working with the FLC formula, for example, involves more than just * or /.

This would be an easy way to upgrade the theory tests without even changing their content (I'm not saying I'm not in favor of changing their content); requiring that the examinee supply the correct answers himself (rather than using the multiple choice format) would be another easy method of upgrading the present exams.

These are both trivial changes but I believe they'd have a (maybe ever so slight) positive effect in having prospective licensees spend more time with test preparation.

Jeff KH2PZ (this is a policy issue; respect the followup line for a change)

Hi All,

A friend asked me about a radio she found in storage. It is a King Quality Neutrodyne K3532 made by King Hinners Radio Co. Buffalo, March 27, 1923. I have not seen it but it sounds like it takes plug in coils. I am not sure if it is a transmitter or a short wave receiver. She thought her grandfather needed a licence for it.

If anyone knows what this is I would appreciate the tip. Please email me at "cgrant@grant.ca".

Thank you very much.

Hello Cecil,

To answer your question:

No, I would not bar any deaf guy from ham radio.
I was ignorant of that problem since you are the
only one mentioning it. All others where whining
that they're incapable of comprehending 4WPM
because of their lack of supernatural talents.

What I'm trying to say is that in an emergency
simple CW Morse might be the only way of
communication. Therefore most of us (I'm not
saying all!) should know code in case
someone was forced to use Morse in
a shipwreck, for instance.

I'm not against FSK either, and I'm definitely pro-digital.
All I'm saying is that there can be situations where
hand-keyed Morse is the only means of getting out!

You're comparing your uP-based FSK decoder to
a transceiver. That wasn't my point. What I was
saying is a one-transistor circuit could operate
as a CW transmitter and receiver in an emergency.

Regards,

(the ghost of) Sam Morse

Randolph Kielich (randyk@emf.net) wrote:

: I think everyone has at some point. I keep remembering hearing
: the call sign of N4RH at the FCC and it never dawned on me that he had
: a custom call sign with his first and last name. I guess it came from
: another period in the 70's or 80's when this was done.

Come to think about it, I've already had a vanity callsign. When I was in the Air Force and stationed in Japan, I had KA2JL. Our callsigns were issued to us by 5th Air Force, and we could request specific ones.

Looking at a DXCC prefix list, I don't see the KA prefix so, apparently, they no longer exist. Not sure if it would be possible to request a reissue of that callsign, but it would probably cause more confusion that it's worth.

: It's very understandable and it's a sensitive subject to say the
: least. I keep thinking there must have been more available options for your
: district? Did you ever look at a full list? I had about 500 calls that
: I looked through and it was only by chance that I ran across one that I
: found interesting. BTW, I turned down W6DX as I believed that it was so
: 'loaded' with that high powered hot shot DX'er energy that no matter what
: I did with it I would always have to answer questions about this or that,
: not to mention the more troubling reality of my difficulty with pronouncing
: the letter 'W' since my head injury of three years ago and thus my
: 'attempt' and obtaining a shorter 'W' free call.

I considered trying to get the callsign of a past club member to honor his memory, but that seems to wear better as a club callsign, which we have already. At any rate, I would have asked around at the club before I approached his widow on the matter.

: Not everyone is so stressed. This 'program' has been so long in
: coming and so fraught with fighting between the ARRL & the FCC and then
: the Government shut downs, it's a miracle that it's actually up and running
: after all this time. Just for the record the ARRL wanted the $$ amount to
: be over $100. (can't remember the exact amount). That was a weird twist
: to say the least, I mean custom call signs for the well off ;-$

Another good reason I don't support ARRL unilaterally.

-->Mark Odegard wrote:
-->: I've offered /'keI bEk/, /'kE bEk/, even /'k@ bEk/. This of course is
-->: with a midwesterny-Californian American English "accent".
-->
-->: For those unfamiliar with the version of the IPA we use here on a.u.e,
-->: here's a translation:
-->
-->: [eI] is the "ei" in "eight".
-->: [E] is the "e" in "end".
-->: [@] is the schwa, the "u" in "but".
-->
-->: To this, there is the "w" pronunciation, /'kw@ bEk/ or /'kweI bek/,
-->: and (probably) the one everyone will stigmatize, /'kwi bek/ ([i] is
-->: "long e", as in "queen"), wherever the stress is put.
--> ....
-->: For myself, /'kE bEk/ seems closest to what I do, roughly "keh-beck",
-->: with the first vowel being that in "Ken", "keg", or "kept".
-->
-->In the 4 out of 4 US dictionaries I've looked at, the "w" pronunciation
-->(in one variant or another) is listed as the standard English pronunciation,
-->and some variant of /keI bEk/ is listed as the French.
-->
-->My question is, where does /'kE bEk/ come from? It's not the French
-->pronounciation, because there's an accent aigu over the first "e":
-->
--> In ISO-8859 characters: Qu&#65533;bec
--> ASCII convention: Que'bec
-->
-->Thus the first "e" sound is a French phoneme that doesn't exist in
-->English at all. It's the French version of "ay", as in "day", but
-->it is short and pure, so it's NOT /eI/, the English diphthong version
-->at all. But certainly, if you're trying to mimic the French
-->pronunciation with English phonemes, /keI bEk/ is MUCH better than
-->/kE bEk/. So: where did THAT pronunciation come from?

You seem to have answered your own question. /kE'bEk/ (I've never heard /'kEbek/) is as close as we can get to the French pronunciation using the phonemes of English.

As for your assertion that "/keI bEk/ is MUCH better than /kE bEk/" I strongly disagree. Personally I find it MUCH worse. I wonder what a French-speaker would make of it. (If I try and say

/keI'bEk/ I end up saying /ke'bEk/.)

In the UK the standard pronunciation has always be /kw@'bEk/ or /kwI'bEk/.

When I first heard /kE'bEk/ I assumed that it was some kind of PC-motivated sop to Quebecois national sentiment, adopting a pseduo-French pronunciation rather than the traditional English one. Is this the case or have anglophone Quebeckers always used such a pronunciation.

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 30/2330Z SEPTEMBER 1996 BY IPS RADIO AND SPACE SERVICES
FROM THE AUSTRALIAN SPACE FORECAST CENTRE
SUMMARY FOR 30 SEPTEMBER AND FORECAST FOR 01 OCTOBER - 03 OCTOBER

1A. SOLAR SUMMARY
Activity: Very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 70/5

GOES satellite data for 29 Sep
Daily Proton Fluence >1 MeV: 9.1E+05
Daily Proton Fluence >10 MeV: 2.1E+04
Daily Electron Fluence >2 MeV: 2.0E+08 (moderate)
X-ray background: A1.8
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
01 Oct 02 Oct 03 Oct
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 01 Oct: 70/5

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: Quiet

Estimated Indices : A K Observed A Index 29 Sep
Learmonth 7 2222 2222
Fredericksburg 6 8
Planetary 5 8

Observed Kp for 29 Sep: 2332 1221

2B. MAGNETIC FORECAST
Date Ap Conditions
01 Oct 18 Active
02 Oct 10 Unsettled
03 Oct 10 Quiet to unsettled
COMMENT: IPS Geomagnetic Warning 11 was issued on 28 September
and is current for interval 30 September to 1 October. Forecast
disturbance has failed to eventuate. There is a chance for active
periods on 01 October if disturbance is "late".

3A. GLOBAL HF PROPAGATION SUMMARY
Latitude Band
Date Low Middle High
30 Sep Normal Normal Normal
PCA Event : None

3B. GLOBAL HF PROPAGATION FORECAST
Latitude Band
Date Low Middle High
01 Oct Normal Normal-fair Fair
02 Oct Normal Normal Fair
03 Oct Normal Normal Normal
COMMENT: Degraded/depressed HF conditions are now not expected
for 01 October.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Date T index
30 Sep 3

Observed Australian Regional MUFs:
Darwin: No data.
Townsville: depressed 15% during local day.
Sydney, Hobart: near predicted monthly values.

Predicted Monthly T index for September: 9

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
Date T index MUFs
01 Oct 5 near predicted monthly values
02 Oct 5 near predicted monthly values
03 Oct 5 near predicted monthly values
COMMENT: IPS HF Communications Warning 17 was issued on 28 September
and is current for interval 1 October only. Forecast disturbance
has failed to eventuate. Near normal conditions now expected.
Due to compute problems no data after 16UT. Also, Darwin sounder
has failed.

This is a new use of the WWW that can benefit ham radio operators throughout the world.

You can now schedule contacts with hams all over the world simply and easily by using the WWW and e-mail.I have set aside a section of my web site for hams to post their request for over-the-air schedules. Included in the posting is a place to list the posters specific ham radio contact needs (countries, zones,IOTA, grid squares ect...). The postings will also include an e-mail link that will allow hams that read the posts, to easily request an over-the-air schedule.

How Can Cyberscheds work for me?

Do you need a certain state to complete a WAS award? Are you just a few countries away from a DXCC? Are you a QRP operator looking to make contacts with hams all over the world? Are you a DX station that has grown tired of the stateside pile-ups on 20 meters? Or are you going mobile into a hard to work county?

In all the above examples you could have prearranged cyberscheds with those hams that you want to work. If band conditions are poor just e-mail the hams you could not work and set up a new schedule.

Cyberscheds are a simple way to have the internet work to the benefit of hams all over the world.

All posting will stay on-line for 6 months, or until the posting is asked to be deleted. Below is an example of one cyberpost visit the cyberpost page and view them all
---
Station: BV/N0IAT

Name: Joe Fitter
QTH: Taipei, TAIWAN Republic of China
Bands: 40/20/17/15/10
Mode: CW (occasional SSB, but not much)
Comments: Looking for South America, Central America, and Carribean QSO's. I QRV from a
neighbors shack (local law), so operating times are limited to station availability. QSL via my CBA --
I DO NOT accept IRC's or Greenbacks, just please send me your QSL card and a route for returning
the favor.
Post Date: Sept. 6, 1996

Visit http://www.sarrio.com and participate in your first cybersched.

4073. Weekend HAM RADIO CLASSES

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-30 00:00:00 UTC
From: Mitch Stern <wb2jsj@vbi.champlain.edu>
Message-ID: <3250BF8F.7054@vbi.champlain.edu>
Source record: 215766

I am offering a series of Weekend Ham Radio Classes designed to prepare students for the Technician Class amateur radio license.
These classes are located in New York and New England.

Classes are 14-16 hours total, spread over 2 or 3 days. Instruction consists of discussion, demonstrations (with live Ham Radios), practice quizzes and (ugh) homework. The combination seems to work, as previous classes have posted a 95% pass rate.

Upon enrolling in the class, I send out a course book and workbook for students to get familiar with the material. Early enrollment is important, as it allows more reading time. At the conclusion of the course, Volunteer Examiners administer the Technician exam.

Available courses:
Oct 4,5,6 (Fri night, Sat morn, Sat night, Sun morn)
Boxboro, MA (New England Ham Radio Convention

Oct 12-13 (Sat-Sun)
Burlington, VT

Oct 26-27 (Sat-Sun)
Albany, NY

Nov 9-10 (Sat-Sun
Manchester, NH

For information and FAQ, access website:

4074. Re: Vanity call regions

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-30 00:00:00 UTC
From: Michael Herron <GHURRICANE@gnn.com>
Message-ID: <52qaai$22m@news-e2b.gnn.com>
Source record: 215767

I understand you can pick from the continetal call areas as you wish but not a KH6 KL7 or similar "off shore" call area. All this stuff is available on the ARRL's web pages. Hard to believe people are just starting to ask at this late date about this stuff that has been out for nearly a year now.

Message-ID: <52qbfn$2bi@news-e2b.gnn.com>
Source record: 215769

Bottom line is that there will allways be us CW ops on the ham bands. If for no other reason than that it is fun, and not so hard to use after you have applied yourself to it to get some speed up to a reasonable clip say 25 to 30 wpm. Iam sure alot of people would rather everything be handed to them like welfare and unemployment but they have little or no real dedication to their plight. They will be here today and gone tomarrow. Allways looking for an easier way to to get something they won't appreciate much in the end anyway. The best thing I've seen happen since no-code is a big increase of quality used VHF ham gear available from those who only have marginal interest in hamming. I bought a almost new FT-5100 for 300 bucks a year ago from such a person and he threw in about another $150 worth of ARRL publications and mobile antennas!!

4077. Correction to Ohio/Penn DX Bulletin #272

>Have you determined that of the 44% who told the ARRL that they never use
>Morse, how many were HF operators, having had to pass the 13 and 20 wpm

Last week we were told that 82% of us don't use HF. Now 56% of us
do use code. That's an awful lot of non-HF CW.

Don't you just love statistics?

4079. Best Hamfest in Canada, November 9th

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-30 00:00:00 UTC
From: "Christopher Dean (VE3TBP)" <chris@openstore.com>
Message-ID: <32507985.17FD@openstore.com>
Source record: 215772

For Immediate Release in the public domain: permission is granted to freely distribute this information!

HEADLINE
York Region Amateur Radio Club welcomes thousands to Newmarket Ontario, Canada on November 9th!

INFORMATION
Web Site:
http://www.openstore.com/yra

CONTENT
Dubbed "Dayton North", the YRC Hamfest is arguably Canada's premier Amateur Radio Event.

Visitors from all over the world attend this event year after year. Last year, due to the demand for even more parking, we added free shuttle busses from a nearby facility offering virtualy unlimited parking space.

This year we add a fun activity center for children and parents so that this event now becomes a family occasion!

Whether you want to check out the new rigs from the major vendors, are looking for that elusive "boat anchor", or just a few feet of cable and a connector, we have it ALL! If it isn't here, you can't get it in the country!

Talk in on the VE3YRC, Club repeater, 147.225+ covering Lake Simcoe to south of Toronto.

Check out the Web site (click on the York Region Amateur Radio Club display) for more information as it happens
http://www.openstore.com/yra

Join this uniquely Canadian tradition, migrate to Newmarket to start the Canadian winter DX season!

'73 and see you there...
The York Region Amateur Radio Club

In order to answer your question I will have to make the assumtion
that the antenna you are going to feed is an HF antenna and not
VHF/UHF. If this is correct, than I would not worry about the loss
due to the long coax run. Losses in good coax at HF are not very
significant except at 10 Meters. Even on 10M the losses are not
enough to worry about. In order to reduce the losses, use a good
grade of coax such as 9913 or similiar. If the antenna is resonant,
no antenna tuner will be required. The tuner would only serve to add
one more source of loss.

Good point; I should have said "real time" QSOs. You get infinite bandwidth with infinite latency.

> Because there just isn't as much HF spectrum Isn't that
> obvious. Many pro-code pundits keep pointing out
> that VHF and above is 99% greater frequency spectrum than
> HF (1%).

And, as you well know, most crowd into 2m, with a few jumping to UHF. The spectrum wars between the weak signal folks and FM simplexers are just the beginning.

> Carl's opinion of what might be is his. The real issue once again
> is for the government to justify why anyone in 1996 should be
> forced to learn CW, a mode that has no support outside the
> amateur spectrum.

Industry has pretty much abandoned HF alltogether for satellites. So as long as we're content to be industrial sheep, I guess it's time to give up on HF? Industry has different needs and different budgets than amateurs.

The issue is: What if we quadruple the number of hams on the HF bands, all using SSB? Since they don't know CW, no suitable alternative exists, and have historically clung to wideband modes, why should we expect anything different to happen?

> so would a single 5 WPM code test be enough?

Yes. 5 WPM is pretty much the minimum to prove that you can use it, which
in turn is the limit of the government's regulatory interest in seeing that
CW continues until a suitable replacement exists. Anything beyond that
is more of a mastery, and there are probably more important things to master.

CONTEST REMINDER

JUST A NOTE TO REMIND YOU THAT THE CQ/DJ WW DIGITAL CONTEST IS
BEING HELD THIS WEEK.

COLS COLUMN.

PAT VK2JPA IS ON HOLIDAY THIS WEEK, SO I HAVE BEEN GIVEN THE
HONOUR OF COMPILING THE BROADCAST. THE PROPAGATION ON 40 METRES
IS STILL NO BETTER, WHICH IS VERY DISAPPOINTING. AT THE MOMENT
3 OR 4 CALLBACKS IS ALL THAT I AM GETTING. HOWEVER, JOY OF
JOYS THE 80 METRE CAST ON SUNDAY EVENINGS IS DOING MUCH BETTER,
QUITE A FEW STATIONS TAKING PART. THE REGULAR ONES BEING JIM
VK2BQS JOHN VK2BAT VICTOR VK3BVJ AND DAVID VK7KDM, WITH OTHERS
AT VARIOUS TIMES. THKS TO ALL THOSE STATIONS FOR MAKING SUNDAY
EVENINGS A SUCCESS. THE OTHER DAY I DOWNLOADED THE ARRL SOLAR
REPORT, IT CONTAINS INFORMATION REFERENCE THE SUNSPOT ACTIVITY
AND I INCLUDE IT IN THIS CAST.
LAST WEEK I SAID THAT MORE EARLY COMMUNICATIONS WOULD APPEAR IN
THIS WEEKS COLUMN.
TO THIS DATE, I HAVE BEEN DEALING WITH SYSTEMS THAT UTILISED
STATIC ELECTRICITY, WE NOW MOVE ON TO THE GALVANIC TELEGRAPH,
THAT IS A SYSTEM USING AN ELECTRIC CURRENT, A FLOW OF
ELECTRICITY THAT WOLD LAST FOR AN APPRECIABLE TIME RATHER THAN
A MOMENTARY DISCHARGE THAT COULD BE OBTAINED FROM A LEYDEN JAR
(EARLY CAPACITOR). BEFORE DESCRIBING ONE OF THESE SYSTEMS, I

WOULD LIKE TO WRITE A SHORT NOTE ON THE EARLY 'BATTERIES' THAT PROVIDED THE POWER FOR THESE SYSTEMS. THE FIRST GALVANIC TELEGRAPH WILL APPEAR NEXT WEEK. THERE ARE THREE NECESSARY COMPONENTS IN A SUCCESSFUL TELEGRAPH SYSTEM. A TRANSMITTING DEVICE, A MEDIUM PROPAGATING THE SIGNAL AND A RECEIVING DEVICE. ELECTROSTATIC SYSTEMS FAILED IN EACH OF THESE COMPONENTS. FRICTIONAL MACHINES PRODUCE TINY CHARGES OF ELECTRICITY AT VERY HIGH POTENTIALS. UNLESS THERE IS GOOD INSULATION, THE CHARGE LEAKS RAPIDLY AWAY TO EARTH. IN THE FIRST TWENTY YEARS OF THE 19TH CENTURY, TWO ADVANCES IN ELECTRICITY GAVE EXPERIMENTS A MORE RELIABLE SOURCE AMD THE TELEGRAPH WAS TRANSFORMED INTO A USEFUL DEVICE, RATHER THAN A SCIENTIFIC TOY.
THE FIRST ADVANCE WAS THE SUBJECT OF A LETTER TO THE ROYAL SOCIETY IN 1800, IT WAS FROM VOLTA. HE DISCRIBES HIS FAMOUS 'PILE' FROM WHICH A FLOW OF ELECTRICITY LASTED FOR A CONSIDERABLE TIME. VOLTA WAS INSPIRED BY GALVANI'S WORK ON THE MUSCULAR MOVEMENTS OF FROGS. AS WELL MAKING A FROGS LEG MOVE BY A FRICTIONAL MACHINE, GALVANI NOTICED THE LEG WOULD ALSO MOVE WHEN TOUCHED BY SPIKES OF DIFFERENT METALS, SUCH AS COPPER AND IRON. HE CONCLUDED THAT THESE PHENOMENA WERE CAUSED BY 'ANIMAL ELECTRICITY'. VOLTA SHOWED THAT THE PRIMARY CAUSE WAS A SOURCE OF ENERGY AT THE JUNCTION OF DISSIMILAR METALS. IN ORDER TO DEMONSTRATE THIS CLEARLY, VOLTA BUILT UP A PILE OF METAL DISCS. HE LAID A SILVER DISC ON THE TABLE, THEN A ZINC DISC ONE ON TOP OF IT. EACH DISC WAS ABOUT 2 AND A HALF CENTIMETRE IN DIAMETER. OVER THIS HE LAID A DISC OF CARBOARD SOAKED IN WATER OR BRINE. HE CONTINUED THE PROCESS OF LAYING THESE THREE DISCS ON TOP OF EACH OTHER. THE ZINC AND SILVER DISCS IN CONTACT WITH EACH OTHER PROVIDED A CONTINUOUS FLOW OF ELECTRICITY. THIS WAS THE FIRST BATTERY MADING POSSIBLE A WHOLE NEW SERIES OF EXPERIMENTS IN THE INVESTIGATION OF CHEMICAL, HEATING, MAGNETIC AND OF COURSE TELEGRAPHS ETC. ELECTRICAL RESEARCH NOW MOVED FORWARD AT A GREATER PACE.
THE SECOND ADVANCE IN KNOWLEDGE WAS THE DISCOVERY BY OERSTED IN 1820, THAT WHEN A WIRE CARRIES A CURRENT OF ELECTRICITY IT EXERTS A TURNING EFFECT UPON A COMPASS NEEDLE PLACED CLOSE TO AND PARRALLEL TO IT. IT LINKED THE TWO SUBJECTS, MAGNETISM AND ELECTRICITY. IT SHOWED THAT ELECTIC CURRENTS COULD EXERT MECHANICAL FORCE, THUS LAYING THE FOUNDATIONS OF ELECTRICAL ENGINEERING.
THE IMMEDIATE EFFECT ON THE DEVELOPMENT OF THE TELEGRAPH WAS TO PROVIDE, IN THE FORM OF NOTHING MORE COMPLICATED THAN A DEFLECTED COMPASS NEEDLE AS AN INDICATOR OF ELECTRIC CURRENT. AMPERE SUGGESTED A TELEGRAPH USING THIS TECHNIQUE, BUT NEVER BUILT ONE.
NEXT WEEK I SHALL ATTEMPT TO DESCRIBE ONE OF THE EARLY SYSTEMS USING A VOLTAIC PILE, UNTIL THEN 73'S DE COL

IONOSPHERIC REPORT AND FORECAST.

I AM UNABLE TO BRING YOU THE REPORT FROM THE I.P.S. THIS WEEK
HOWEVER AS STATED ABOVE I HAVE THE ARRL SOLAR REPORT IN ITS
PLACE.

QST de W1AW
Propagation Forecast Bulletin 39 ARLP039
>From Tad Cook, KT7H
Seattle, WA September 20, 1996
To all radio amateurs

SB PROP ARL ARLP039
ARLP039 Propagation de KT7H

Solar activity was down again last week. Average Solar Flux was
down about a point, and average sunspot numbers were down about
3.7. Every day except September 12 had no visible sunspots.

The daily solar flux was below the 90 day average of 71 on each
day over the past week.

Solar activity is expected to increase over this week, with
solar flux to peak in the mid 70s around September 24 to 16.
Geomagnetic conditions are expected to peak around September 25
with A indices around 25 and K indices as high as 5.
After October 1 solar flux should drop below 70. Geomagnetic
conditions should get unstable again around October 7 to 13.

The days are growing shorter, and the Fall Equinox will arrive
September 22. Because of less daylight 20 meters is becoming
more of a daylight band.

Sunspot Numbers for September 12 through 18 were 11, 0, 0, 0, 0,
0 and 0, with a mean of 1.6. 10.7 cm flux was 67.8, 67.3, 67.1,
66.4, 68, 69, and 68.9, with a mean of 67.8.

VK2SG RTTY DX NOTES FOR WEEK ENDING SEPT. 20, 1996

Notes of Interest:

5R, MADAGASCAR - For those still needing this one look for Gerard, 5R8EN who will stay there until the middle of October.

ANGOLA, D2 - Alex, PA3DZN states to be active in early October from Luanda for a period of 6 months. Operation will be CW, CW, CW, RTTY, and SSB.

SPECIAL PFX, IY1EY - During the 'LOANO ELETTRA AWARD' to celebrate Marconi's radioelectric experiments on the Elettra ship from 1919 to 1936 on Ligurian Sea, will be on from the 21st to the 29th Septmeber the special prefix IY1EY. Activity on all modes CW/SSB/RTTY all bands. A special QSL card reproducing Marconi's legednary boat 'Elettra' will be issued via IK1QBT, Tony.

The VK2SG RTTY DXNOTES are also available on Internet at reflector digital-dx(at)st.rim.or.jp and the OH2BUA Webcluster at URL http://www.clinet.fi/jukka/webcluster.html.

For next week's bulletin send your bandpass and notes oF interest to Bob, WB2CJL(at)W5KSI.(hash-sign)NOLA.LA.USA.NA .

ARRL DXNOTES

>From ARRL Headquarters
Newington CT September 19, 1996
To all radio amateurs

ARLD043 DX news

This week's bulletin was made possible with info provided by Ted, KB8NW, the OPDX Bulletin, 425 DX News, Martti, OH2BH, and Contest Corral from QST. Thanks to all.

MADAGASCAR, 5R. Jean Michel, F6AJA, is in France after his 5R8FI operation and will have QSL cards printed soon. Jean has the 5R8EN logs up to September 7th, with the 5R8EN/P logs from Nosy Be, and is preparing a short 5R8EN/P story. look for Gerard, 5R8EN, on RTTY until mid October.

UGANDA, 5X. Peter, 5X1T, aka ON6TT, reports he has some windows to work Europe on the RS-12 satellite, between 1900-2000z, for the next couple of days.

ANGOLA, D2. Alex, PA3DZN, expects to be active in early October from Luanda for a minimum of 6 months. He plans to use his TS-50 and R7 on 10 - 40 meters, but a Force-12 C4 beam and a 600W amplifier will be shipped to Luanda as well. For 80 and 160 meters, he will try to install the usual wire antennas. Operation will be on CW, RTTY, and SSB. QSL information ''TO BE ANNOUNCED.''

GUINEA BISSAU, J5. Hans, DK9KX, and Dieter, DJ9ON, members of the Cologne DX Group, are active on 80 to 10 meters, as J59KX and J59ON, respectively. This DXpedition is also joined by Anne, DF3KX. Anne uses a 100 watt transceiver and a R-7000 vertical. Operations will be mostly CW, with SSB and RTTY as well. QSL via home calls.

KH7 CONFUSION. Lee, KH6BZF, reminds amateurs that the FCC has started issuing KH7 licenses to Hawaiian Amateurs. KH7 callsigns have been appearing on the bands in the last week or so. These are NOT Kure Island callsigns.

MYANMAR, XZ. In preparation for the official opening of the Visit Myanmar Year 1996 and the large scale XZ1N amateur radio operation in November, Martti, OH2BH, will be visiting Myanmar on September 21 and 22.

Station XZ2BH will be sporadically on the air on several bands, including the Scandinavian Activity Contest. Equipment includes a Yaesu FT1000MP and the Alpha 89 amplifier.

QSL INFORMATION AND NEWS.

There has been a QSL Manager change in the upcoming ZV0MB and ZV0MV DXpedition. PT2DX was announced earlier as manager, but his address is not in the current callbook. PT2GTI was announced as QSL Manager for the Martim Vaz Island DXpedition. QSLs go to PO Box 09647, BRASILIA, DF, 70001-970.

The Danish QSL Bureau has changed their address to : EDR QSL BUREAU, Klokkestoebervej 11, DK 5230 Odense M., Denmark.

ISLANDS ON THE AIR (IOTA)

FOR THOSE STATIONS INTERESTED IN IOTA, HERE ARE A COUPLE OF IOTA DX SNIPPETS.

>From: Kenneth McCormick <mccormick(AT)ns.sympatico.ca>
>Subject: CY9AOE St.Paul Isl.

As of Tues, Sept 17 the planned Dxpedition to St.PauL Isl.(CY9) is still in the works. We had planned on leaving today and landing on Weds but due to the recent hurricane activity on the east coast of North America, it has been impossible to land on the island because of high seas. If the wx should cooperate we will leave on Weds, Sept 25 by boat and be on the air that evening or the following day. The call for this operation will be CY9AOE and QSL to VE1AOE. Hope to hear you from St. Paul Island. Don VE1AOE and Ken VY2RU (VE1RU).

4093. NEW Kenwood unit coming soon?

Newsgroup: rec.radio.amateur.misc
Date: 1996-09-30 00:00:00 UTC
From: Rich Fortnum <fortnum@pints.com>
Message-ID: <324FCF8D.6CF8@pints.com>
Source record: 215877
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap,rec.radio.amateur.misc

New Kenwood base unit due out soon? I was told yesterday by a sales person that there is word out from Kenwood themselves, that there will be a new unit released, with DSP, to replace the TS-450. The model number is not known. It will also retail, apparently under CAN$2000. Not bad, eh? I'll be up for that one.

Anybody have more information?

From QST August 1995 (page 26).

This journal describ a very interresting keyer.

So, do this keyer can do a beacon (or cycling calling
with programmable waiting) ??

If yes, I would like to buy it from France :
What to do : is credit card available ?

Thanks for any answer.

I found your response interesting as it implied (to me, anyway) that you must see the removal of the compulsory Morse exam as the death of Morse. Did I interpret this incorrectly, as I can't see that the removal of the exam will have any long term impact on Morse use? Ultimately, amateurs either forget Morse or use it. I suspect that 5 years after the exam is dropped, the ratio of CW to non-CW users would be basically unchanged. Am I too optimistic, do you think?

> Will ham radio still be fun? Yes, as a window on an earlier time, an

>

Not being into nostalgia, I'd like to think that the developments that are the cutting edge today will be slotted into Amateur Radio tomorrow. As equipment comes off the edge, it becomes available to the resourceful amateur. On the other hand, I guess you are right, AR is always behind the commercial world, but hopefully it will be a sliding window moving to the future, not a static view of a time long past.

Ideally, my future for AR contains some of every facet of radio, new or old.

I wasn't looking for W4DX but my first choice was also taken during gate 1.
I've been hamming since March 1974 and missed the last vanity opening because
I was only Advanced class. Well, I've had my eye on "K1TA" for 20 years and
it was scooped up by a 6 lander!

If there is a God maybe I'll get my #2 pick. <big grin>

I remember the same thing, of sorts. I passed my General 1 year to the
day of getting my Novice (For those who don't remember then you had 2
years
to upgrade or get off the air for a year. No presure there!) This was
May of 1975 and I remember waiting the ENTIRE SUMMER for them to write
my
new ticket (which just changed my WN1 to WA1TNK) I received it 22 1/2
weeks
later in November. Man was that a BAD summer.

Hello, Folks:

On October 13, 1996 the Eastern Ozarks Amateur Radio Club (EOARC) will sponsor a Fox Hunt in St. Francois County Missouri.

Sign up will be from 1300-1330 at the Mineral Area College parking lot in Park Hills (formerly Flat River) and the Hunt itself will start at 1400.

Entry is _FREE_ but you must register!!

Maps of St. Francois County will be provided.

The Fox will live on 2m FM simplex and the exact frequency will be announced by the Fox at 1400. The Fox will be somewhere in St. Francois County.

Certificates and ribbons will be awarded.

From St. Louis, take Interstate 55 south to US highway 67 south to the Leadington/Park Hills exit then turn left.

From Cape Girardeau, take Interstate 55 north to US Highway 67 south as above.

From Poplar Bluff, take US Highway 67 north to exit as above and turn right.

You may call on the EOARC repeater on 147.030 (+600) for talk-in.

All Amateurs are welcome and encouraged to attend!

Take Care & 73

As an outsider, my image of the area is that everything was up-to-date in
Kansas City, and that they're gone about as fer as you can go.

For this reason, perhaps there should be more radio stores in Kansas
City.

A recent exchange, names deleted to protect the "innocent":

>> So I guess it's more anxiety and dread until I determine if mine
>> got there too early even with the bank clearing my check.

>Hey Xxxxx, ever consider getting a life? :-) Ham calls don't
>deserve all that energy.

I decided not to go for a vanity call. When I moved to the Northwest in 1979, I did change my call. I wanted my number to reflect my region. So I went from WA1KTA to KD7MW. I got my Extra in 1984. I could have gotten a 2x1 call, but I didn't like the rhythm of those calls on the air. I did like my present call, and by then a lot of people knew me as KD7MW, so I stuck with it.

When Gate 2 loomed, I toyed with the idea of trying for a 1x2, but decided not to. The only available 1x2 with my current suffix belonged to a deceased ham who I used to handle traffic with in the early '80s--I just wouldn't feel comfortable being known by the call of someone I used to know.

Then it hit me. KD7MW is my ham "name." I've been known by it for 13 years. Why change it? I'm not such a hot shot DXer/contester that one less letter in my call would increase my QSO/millisecond ratio. :-)

Seeing all the stress folks are going through is further evidence I made the right decision. If I currently held a 2x3, I probably would have gone for a vanity call, or taken an Ax7xx Extra 2x2 as a consolation prize. But KD7MW's good enough for me.

73,
Peter - KD7MW

I find it hard to believe that you knew for a fact that every repeater you might have been able to hit on an opening were on different PL's.

I'm not familiar with Florida, but in Houston, most of the repeaters do not use tone, so chances are if you were ducting into Texas, you were hitting someone elses repeater.

I do agree with the earlier posts, repeaters are designed for local use, remember when you took your test, local mobile users are to have priority on repeater use.

I've known people to request QSL cards when working a distance station through the repeator, actually the QSL card should go to the repeater trustee, you didn't make contact to anyone but the repeater. When the repeater trustee gets the QSL card if you were being legit about who should get the card, you would probably get a note back asking you not to use the repeater in band openings.

From: ke4htm@bluenet.net
Message-ID: <52o0ju$e5m@clark.zippo.com>
Source record: 215896

Now that I've gotten your attention.
I'm not a code hater, I do not have my morse code and do not plan to get it but I do not hate the code.
The reason I'm writing this is to ask that the sensless war on code stop. By fussing back and forth for years your not doing anything but taking up bandwidth. I mean the ITU and FCC have the final say so on this matter. We can yell and scream and do like in the olden days before black were excepted and talk no-codes and drag them behind cars, or make them stay only on this frequency or band, but when it all comes down to it, only the FCC and ITU can say you must get your code or you must get out of radio. Is it such an issue that we would actually lose sleep over it? Coded hams have there HF bands and us NO-codes have 6 meters and up. We never even have to speak if the coded hams didn't want to.
I'm proud to be a ham. I've run a APRS packet station for about 1 year now and I see no need for HF or code to do this. I'm quite happy. And isn't that way we all get a hobby? to be happy? I would hope so.
So folks let the code war stop. It is not important. We and wasting bandwidth and airspace when we can't change what the FCC and ITU says.
Be kind to your fellow ham. Puttingg him down for being a no-code will not make him get his code any faster.

From: jhardy-k4hav
Message-ID: <324f3942.38459672@snews2.zippo.com>
Source record: 215897

Several days ago I posted an announcement entitled "FREE for the Taking" reference my latest software program to convert and search the FCC Amateur Radio Database that can be downloaded from the FCC FTP Site.

I had done my earlier tests on the large 32MB (zipped) file but did all my later testing with one of the 11 small parts that is broken down by zip code. That is when I added the Date of Birth field to the saved info. For some unknown reason the FCC uses two different DOB formats for the two files. In the large file they use May 5 1939 and in the smaller files they use the "390505" format. If you tried to convert the large file then the DOB will indicate that you are minus 73 years old. At least it converted to a nice age.

I should have tried the program again with the large file but didn't. Now I know "Never Assume Anything". Anyway I have written Version 1.1 which has two DOB conversion routines and it picks the correct one to use. If you have already downloaded V1.0 from my web site then please drop back by and just get the FCC.EXE (V1.1) program file. Also made several other small changes. It is at the end of the web page in a paragraph that starts off with "OPPS...."

The web page URL is http://www.surfsouth.com/~jhardy/fcc.htm

Sorry for any inconvenience. 73, Jim Hardy - K4HAV

> Am I too optimistic, do you think?

I think 5 years after the morse requirment is dropped, there will be millions of new hams, 98 percent running exclusively SSB, most with KW or better linears. So yes, the percentage of morse users will be reduced thereby.

I see the removal of the testing requirement as a further lowering of the entrance requirements for ham radio. If the theory and math tests are made more difficult to compensate, then we'll have more engineers and fewer non-technical trades and professions in ham radio, and I don't see that as necessarily a good thing. Besides, why would the tests need stiffening, if the morse test requirement is dropped?

Will morse survive? I think the better question is, will ham radio survive. We gave up an HF band (11M) to satisfy the demand for no-code HF, and look what happened. History has a way of repeating itself. Only time will tell.

>
> Ideally, my future for AR contains some of every facet of radio, new
> or old.

I hope you will enjoy it through all the QRM, when all those millions of new hams get their KW SSB rigs on the air. The only happy people are likely to be the equipment manufacturers, who will become much wealthier.

Regards,

Jim

In 1959 I became a Novice, and the license term then was 1 year and
you could only get it once in a lifetime. I took and flunked the
General 13 wpm test 7 times due to stress. Finally, a week after
my Novice expired I passed the darn thing. Then waited 2 months
off the air!

Gary,

Thank you for your response. I appreciate that you can relate
to the Morse/no Morse question with technical objectivity.

However, I did not mean to say that Morse is some kind
of a mystically unique code. I said that it is the simplest
digital code in a sense that it can be (and have been) used
without much complex equipment, plus it is widely known
around the world.
The idea is hand keying and receiving by ear. I read that
you can pick up RTTY by ear. I'm very much impressed
by that.

But the idea of OOK or FSK if that's what you like, Morse
code hand keyed IS important in an emergency. Suppose
in a shipwreck, etc., you want to build a simple tx. I would
try to build a 1-transistor CW unit or even a spark tx...
You would just open your waterproof suitcase containing
your hi-tec chipsets and instruments that you keep with
yourself at all times.

In response to spread spectrum, I'm aware that the military
uses it. I've been much interested in various SS techniques,
but it is discouraging that the chips are not THAT cheap or
available (I waited a year for Stanford Telecom's chips...)
And the top of everything, check the FCC regulations
about amateur SS. I can only copy 10WPM Morse, but
the code requirement does not bother me a bit, and as
you've noticed, I support code as long as there's a remote
chance that it may save someone's life somewhere.
BUT the SS limitations of FCC kind of choke any amateur
SS experimentation. So if we want to argue about something,
we should argue about that!

Regards,

Sam Morse

I'm curious as to why you are impressed? If you slow down
RTTY to the rate most amateurs can copy Morse Code, it
is little different than Morse Code. Perhaps the biggest
difference is that RTTY uses a fixed length code and Morse
Code uses a variable length code.

> But the idea of OOK or FSK if that's what you like, Morse

Bill Sohl has been looking for real life examples of this for some
time with no one offering any. This argument can lead one to
the belief that the national speed limit should be 5 miles/hour.
At that speed, few people if any would die in a traffic accident.
That would save 40-50 thousand lives a year!!!

> I can only copy 10WPM Morse, but
> the code requirement does not bother me a bit, and as
> you've noticed, I support code as long as there's a remote

Don't you believe that is a bit extreme? Where is the limit
in terms of what you require or will allow someone to do if
preventing loss of life is the only concern? Do you make it

illegal to sky dive? Requiring every citizen to learn CPR would save thousands more lives than requiring amateurs to learn Morse Code.

> BUT the SS limitations of FCC kind of choke any amateur
> SS experimentation. So if we want to argue about something,
> we should argue about that!

I don't think there is any argument about it, at least none that I've seen put forth in this newsgroup. The current regulations are a bit draconian with repsect to limitations on modulation techniques.

I'm still on the bubble, as far as getting a vanity callsign. I have my eye on a certain 1x2, but I'm sure all of those will be gone early. Of course, the point is moot until I pass the code part of my Extra. :-)

For that matter, I'm still undecided as to whether to check that box on the 610 form for a callsign change, when I get my Extra.

As an alternative, I might try for an earlier 2x2 callsign, such as a KB6xx. If I had changed my callsign to a 6-land call when the 2x2s first became available, I would have one already. I'd like to get a format that shows my longevity (30 years) as a ham but, as someone pointed out to me in another thread, that point will be up in the air with the vanity callsign program.

As far as the "ham name" issue, you're right. But, in my case, I've been off the HF bands for so long (finally getting on again) that I'm only recognized as KF6CR at the club and on the local repeaters. Plus, a couple of the OTs at the club have already traded their Ax6xx callsigns for prior ones, or those of a deceased relative. There will be a lot of "name changes" before long.

Yes, but local ordinances could very well put safety and vehicle
restrictions to work which only affect the equipment as installed
not the actual operation. I've never seen it at work, but some states
have scanner laws which have been upheld consistently. Same
would be at work here. Washington State, like Washington DC,
likes to find creative new ways to tax it's citizens.

Dear Subscribers [newsletter editors please take note):

Our article on the vanity call sign program in The ARRL Letter Update for 9/20/96 was misleading. We should have said: "According to ARRL/VEC Manager Bart Jahnke, KB9NM, the FCC says it won*t grant any applications until all *first-day* applications (electronic or hard-copy) have been received." As stated, this sentence gave the incorrect impression that the FCC was waiting to receive *all* Gate 2 filings before issuing grants. This is certainly not the case, as the article makes clear later.

The FCC continues to enter applications into the computer as they receive them from Pittsburgh, and it will begin to issue grants once all *first-day* receipts have been entered. Applications will be selected randomly for processing, starting with day-one receipts. We'll keep you up-to-date on vanity program news as events dictate.

We apologize for any confusion.

>Gary,
>The idea is hand keying and receiving by ear. I read that
>you can pick up RTTY by ear. I'm very much impressed
>by that.

You shouldn't be. Baudot is a simple uniform code, but each
character still has a distinct sound, just like Morse characters
do. If you can pick out Morse character sounds, you can do the
same with Baudot. The only tricky bit is keeping track of the
FIGS character. Fortunately, almost everyone assumes unshift
on space, so that isn't too big a deal.

Of course as I noted, Baudot RTTY is traditionally done at
a fixed speed of 60 WPM. That's actually an advantage in
the sense that the character sounds are the same from station
to station, and you aren't tempted to break the character
sound down into its individual bits, as those learning Morse
often do. So its easier to learn because you never have the
translation hump to overcome.

Still, it is 60 WPM, so the learning curve is somewhat steep.
As I noted, I can only pick out familiar things, like my call
sign or the RY tuning sequence, by ear. Of course I've never
tried to master Baudot by ear, I've picked up those things
just from long association and without any conscious effort.
The machine does it much better than I could ever hope to
do, so there's no point in bothering to make an effort to
learn it by ear.

>But the idea of OOK or FSK if that's what you like, Morse

>try to build a 1-transistor CW unit or even a spark tx...
>You would just open your waterproof suitcase containing
>your hi-tec chipsets and instruments that you keep with
>yourself at all times.

Since I am by nature very much an air breathing land dwelling mammal,
the chance I'd find myself shipwrecked is extremely unlikely. But in
that unlikely event I would merely activate the personal ELT attached
to the life jacket I'd be permanently wearing any time I approached
a body of water closely enough to possibly fall in, and just wait
for the next SARSAT pass.

If I were marooned on land somewhere there were electronic components (and didn't have anything better to do), I would expect to find chips mostly, even in consumer gear. But supposing I did find some suitable RF transistors, the likelyhood is that I would also find a speaker of some sort, or earphones, and those make dandy dynamic microphones. That would lead me to make an AM set for 121.5 MHz, and holler for an aircraft passing by. At least I know that frequency will be guarded 24x7 by someone with a working knowledge of English.

If I were to build a Morse transmitter for an amateur band, the odds are I'd attract someone whose "English" was limited to UR RST 599 PSE QSL. And that wouldn't be much help at all. If I were to send QRRR over and over, most hams would just tune on by. Now perhaps if I signed a "rare" Dx call.....then I might attract some stations, but they'd all be jamming each other asking for the QSL route until some Kiocycle Kop told them I must be Slim since I'm not on "the list" so they should ignore me.

If I were to need help, HF was my only option, and the best I could do was spark, I don't think the amateur bands is where I'd operate. I'd pick some high value commercial or military channel and be as obnoxious as possible until they sent someone out to investigate. Any repeating noise pattern would do, though I admit that the old Hudson's Bay Company advice of three quick noises followed by three slower noises, repeated over and over would be a good one. It should be easy enough to rig up a wheel to send that pattern continously.

>In response to spread spectrum, I'm aware that the military
>uses it. I've been much interested in various SS techniques,
>but it is discouraging that the chips are not THAT cheap or
>available (I waited a year for Stanford Telecom's chips...)

Special chipsets are convienent, but you can do SS with more generic parts. It's a bit bulkier, but it isn't that hard. That way is more flexible too.

>And the top of everything, check the FCC regulations
>about amateur SS. I can only copy 10WPM Morse, but

>BUT the SS limitations of FCC kind of choke any amateur
>SS experimentation. So if we want to argue about something,
>we should argue about that!

There is a RM before the Commission right now to liberalize the SS rules. It doesn't go far enough, but it is a step in the right direction. If we are to stay relevant, we must encourage amateurs to move to modern communications methods.

What do you base this predicition on? It is more than five years after
the Morse requirement was dropped from the Technician class license,
there aren't "millions" of new hams (perhaps 150,000), many of
the new hams do use FM, but with "barefoot" radios, very few
appear to run more than 50W.

The use of FM isn't surprising since this is the most common
mode on the bands that Technician licensees have access to.

>I see the removal of the testing requirement as a further lowering of the

>survive. We gave up an HF band (11M) to satisfy the demand for no-code
>HF, and look what happened. History has a way of repeating itself. Only
>time will tell.

Amateur radio didn't give up a band to satisfy the demand for no-code
HF. Amateur radio gave up a band to satisfy the need for a low-cost,
short range, personal communications service. The FCC originally
selected UHF for this service, but the manufacturers just weren't
ready to build cheap UHF FM radios, so they FCC added the 11m
AM service, much more appealing at the time to manufacturers. Because

the FCC can't enforce sunspot cycles, 11m became a popular long-distance
service, but it didn't start out this way.

>> Ideally, my future for AR contains some of every facet of radio, new
>> or old.
>
>I hope you will enjoy it through all the QRM, when all those millions of
>new hams get their KW SSB rigs on the air. The only happy people are
>likely to be the equipment manufacturers, who will become much wealthier.

Once again, where did you get this prediction from? There's no
basis in the amateur service for the doom and gloom.

>The idea is hand keying and receiving by ear. I read that
>you can pick up RTTY by ear. I'm very much impressed
>by that.

The simplicity of Morse code is useful, but isn't an advantage in emergencies. The bottom line in an emergency is _how well prepared you are_. If you have no transmitter at all in a time critical emergency, you have no transmitter and the odds that you can construct one at all, much less in time to be of use, are vanishingly small. If you have a transmitter, it really doesn't matter what kind of transmitter it is.

While there's a delightful romantic notion that a lone human can craft up a transmitter and tap out an SOS, this really only exists in the movies.

>But the idea of OOK or FSK if that's what you like, Morse
>code hand keyed IS important in an emergency. Suppose

>try to build a 1-transistor CW unit or even a spark tx...
>You would just open your waterproof suitcase containing
>your hi-tec chipsets and instruments that you keep with
>yourself at all times.

Let's take the worst case first - you're in a shipwreck in the middle of the night. You barely make it to the lifeboat before the ship goes down in 70 feet of water. You have nothing but a tee shirt and boxer shorts on. How do you build a Morse code transmitter?

OK, now a much better case - your boat takes 15 minutes to sink.
Assuming you don't already have a transmitter of any kind (VHF or
HF), what do you build a transmitter out of? How do you verify
the transmitter is working? How do you adjust the frequency
of the transmitter so your signal isn't lost in the AM BCB or
somesuch?

If you don't have some kind of emergency transmitter to start
with, you're not going to have a transmitter. If you have an
emergency transmitter, you've got a chance. If your emergency
transmitter is capable of automatically calling for help without
human intervention, then you can free one more human to help
with the more important job of getting people into lifeboats
with adequate supplies.

Manual Morse code is just not the mode of choice for an emergency.

Because of the speed and the different sounds. BTW variable
length codes are more efficient than fixed length codes if the
probability of the symbols is not equal.

> Bill Sohl has been looking for real life examples of this for some
> time with no one offering any. This argument can lead one to
> the belief that the national speed limit should be 5 miles/hour.
> At that speed, few people if any would die in a traffic accident.
> That would save 40-50 thousand lives a year!!!

No, it does not lead to that argument, because I'm NOT saying
that Morse should be the one-and-only way of communications.
What you're implying is something like this: 5mph is so slow,
so why should we ever drive slower than 50mph? Haven't you
ever been in a situation when 5mph was the fastest you could do?
What if your Porsche was incapable of going slow?
(Not related to the subject: I'm against any kind of NATIONAL speed
limiting)

> Don't you believe that is a bit extreme? Where is the limit
> in terms of what you require or will allow someone to do if
> preventing loss of life is the only concern? Do you make it
> illegal to sky dive? Requiring every citizen to learn CPR would
> save thousands more lives than requiring amateurs to learn
> Morse Code.

It would be extreme if it was so extremely difficult and painful.
Since it's not so, I'm not much worried about that.
Sky divers may kill themselves and that's their problem, not ours.
CPR is a good idea, especially for electrical workers, but, like
you said, for anyone else, too.

>
> > BUT the SS limitations of FCC kind of choke any amateur

This proves that the no-code people are NOT the future bigwigs,
or the restriction on modern communication would bother them
more than the promotion of a simple old code at ridiculously
slow speeds.

It's just my opinion. No more, no less. If you think it would be
different, that would be your opinion, no more, no less.

HF is a different ball game from VHF/UHF, because of it's world wide
capabilities.

> The use of FM isn't surprising since this is the most common
> mode on the bands that Technician licensees have access to.

Most equipment available for HF is SSB, it's easy, it's quick, it's
effective. That's why a lot of people would use it. No particular
significant skill is required.

>

People often argue that while they would be for dropping the morse requirement, they would be for a stiffening of the written tests, to serve as a barrier against the millions of new hams I mentioned.

There was a great deal of political pressure for such a PCS, because those who wanted it didn't want to learn morse code and theory (I remember it). Because of the hordes of users, the licenses and enforceability overwhelmed the government agency responsible for enforcement, and thus the descent into 11 meter anarchy and chaos.

If there are millions of new hams crowding into the existing HF spectrum, my opinion is, those who are hams now are not going to be very happy. The bands are full of users now! The prediction is my opinion, pure and simple, nothing more. Obiously you have a contrary opinion. I hope you are right.

Does anyone have experience using speed writing or shorthand while copying morse code. I am approaching my handwriting limit as far as code speed (around 25 wpm). I know at real fast speeds words are copied but I would still like to write the message down.

Don Krakauskas

Please take the Morse code discussions back to r.r.a.policy, that's where they belong. Some of us have heard all these arguments several times over, and I unsubscribed from r.r.a.p. because I had had quite enough of the Morse discussions. I don't want to have to unsubscribe from r.r.a.m. because there are a few interesting posts now and again (I know, this isn't one of them).

Thanks (he said, without much hope) -

No. The KA6xx calls are reserved and cannot be assigned.

Jim also said:

>I have held an Advanced class ticket since that class was born,
>in 1968.

The Advanced class ticket is the direct descendent of the
"Class A" license, and was born in 1953, not 1968. All old
Class A holders were grandfathered to Advanced at that time
and a few new Advanced licenses were issued in the 50's. Then
tested ended for that class until the resumption of incentives
in 1968. Holders of the class were renewed, however, so a lot
of folks were Advanced all the way back to 1953.

Aside from the fact that I have a lot of fun using digital modes to yak
with other hams (being able to send graphics and pictures on Clover only
touches the surface), I would suggest that you go to the next packet
group at the Museum of Science and Technology every two months. They
have had a number of demonstrations that blew me away. For example,
the work that VE3PFD is doing with his digitized speech experiements
(imagine, a handheld using AX.25 to send digitized speach), or VE3OSY's
efforts of digital FSTV (its a tad jerky, but amazing nonetheless) Note
that both of these individuals have not undertaken to learn Morse code.

There is a heck of a lot more to amateur radio than to sit down and learn
Morse code.

Amateurs have been forced to learn Morse code ever since Marconi was last in St. John's, yet everything was right with the world since that time. On the other hand, Craig interprets that the abolition of Morse code testing as forcing newcomers to use more advanced modes. How drole.

Just a couple of weeks ago, Craig was complaining that the HF bands were anything but - they were too crowded. It is difficult, if not impossible, to comment when faced with such inconsistencies.

>capabilities.

Granted, HF offers worldwide communications, but how would that
result in "millions" of new US amateurs when the Technician
change resulted in about 150,000 new US amateurs? The written
requirements for a code free, or 5WPM only, HF license would
undoubtedly be at least as difficult as the current General,
which is more difficult than the requirements for Technician.
This suggests there would be fewer no/slow code HF amateurs
than Technicians. So, maybe HF would have to absorb 150,000
new US amateurs. That isn't millions.

You're right, your opinion is your opinion. However, an opinion
with no basis in reality, or, worse yet, an opinion which is
refuted by reality, is nothing more than wild speculation or
fabrication.

>serve as a barrier against the millions of new hams I mentioned.

Something I've suggested perhaps 50 times is retaining the current
Morse exams but offering written alternatives. Odds are an implementation
of this idea would offer a selection of written exams, each on a
particular topic and approximately as large as the current Advanced
written. Credit for 1(C) would be granted on passing one of these.
So, someone with a good depth of knowledge on a topic like
RF circuit design, Antennas, Space operation, Digital Communications,
Emergency Preparation, etc., would be rewarded the same as Morse
operators.

The issue is not a barrier to keep crowding down - the issue is
is exam requirements that emphasize desirable knowledge in amateur
radio, looking forward to the future.

What? Hey, end users wanted radio communications. Amateurs tend
to think they've got the only answer for radio communications, and
thus view all radio communications as alternatives to amateur radio.
In other words, you're effectively saying "CBers didn't want to
learn Morse code and Theory" because you tend to accept learning
Morse code and Theory as natural pre-requisites for a radio license.
The fact is, the vast majority of CBers I've met know little about
amateur radio and care even less about amateur radio. They want
radios to talk on, and the issue of Morse code doesn't even enter
into it.

Well, I'm trying to base my opinion on what has actually happened in
amateur radio, not some other radio service (i.e., CB). Common sense
suggests that the changes on HF as a result of changing the code requirement
will be much more like the changes on VHF/UHF since 1991. There haven't
been "millions" of new hams, and chaos has not erupted.

Hey Jim, I am an Extra too, and a CW man actually. Yet I do favor
getting rid of the code test for the amateur license.

There is a difference between doing away with the code test and
doing away with the CW sub bands. Many modes have sub bands,
like CW, digital, weak signal non-Fm for vhf, etc. etc. Then there
are band plans. All intended so no one steps on another person and
annoy him with voices or squeaks and growls.

I have no objection to doing away with the code test. You will still
find me on 14,005 at 30 wpm. And yes, the no coders could then
learn the code, decide they like the action on 14,005 and jump right
in. This is totally logical and compatible.

Hey, the FCC did *NOT* test my ability to talk into a microphone and
give a speech. They gave me a cw test, and yet allow me to work
voice modes. Does this make sense? It doesn't. Ability to use
a certain mode will determine who uses it and who doesn't. The
sub bands will keep decent folks honest and some order in the bands.

Why don't we embrace the proposal?

I don't like some things Carl says. Its obvious he doesn't like CW,
but he is not proposing doing away with CW, just the test for it.
His motive may be suspect, but his proposal is well thought out. I
like it. I have lots of no code friends. And trust me, they are
all fine hams turned out by the S.P.A.R.C and the VE's, including

me.

A new day is breaking in Amateur radio. A new satellite about to go up. The new solar cycle is starting. Lets stop trying to impose our favorite modes on those that rather operate other modes. I could give squat what yelling goes on in 14,313. I stay on 14,005 where it is civilized. But I don't want to dictate that voice modes should be abolished for any reason (and there are plenty, like wasteful of spectrum space). This is a HOBBY, for enjoyment. Lets get on the enjoyment bandwagon and quit bitching.

I am in favor of doing away with the CW test, not the CW modes or sub bands.

Ramon, Nome, Alaska. AL7X <---see, one of these too!

Yes, I'm familiar with variable length codes, but they are irrelevant
to whether someone can copy slow FSK vesus OOK Morse Code
(which is in effect also FSK.) At the time Baudot and ASCII were
developed, they were optimized for mechanical decoding instead
of software or wetware decoding. They were also designed for
media such as punched cards and paper tape that had fixed length
code fields. Morse Code could have been developed as a fixed
length code, but it was not.

You are implying that forcing Morse Code knowledge on
people might in some incredibly unusual circumstance
lead to saving a life. I simply contend that inconveniencing
many on the outside chance somone else would benefit
is not appropriate.

>> Don't you believe that is a bit extreme? Where is the limit

> It would be extreme if it was so extremely difficult and painful.
> Since it's not so, I'm not much worried about that.

Perhaps for you it wasn't, but I think it is pretty presumptuous
of you. I didn't find reaching 13 WPM a terrible ordeal, but
it also isn't something that I'd suggest the government maintain
as a requirement in the odd chance that someone in an emgergency
hammers out 13 WPM of SOS.

> Sky divers may kill themselves and that's their problem, not ours.
> CPR is a good idea, especially for electrical workers, but, like
> you said, for anyone else, too.

If you take the position that the government should encourage
or force people to be in a position to help others, then mandatory
CPR training makes much more sense than mandatory Morse
Code proficiency.

> slow speeds.

Huh? They bother them immensley, but there is little debate as
the issue is pretty cut and dry. I don't hear amateur advocating
maintaining the current restrictions as I do hear them maintaining
the current Morse Code testing. Just because the issue isn't
contested doesn't mean it isn't significant.

> fun on 14005.

I see no problem with this either. In fact I've always thought it
very peculiar that the only Morse Code only segments in the
FCC rule books are in bands that don't require any Morse Code
knowledge to use. I'd rather see band plans, i.e., voluntary
agreements instead of government enforced, but if they don't
provide the protection Morse Code users need, then let them
have some reserved spectrum.

> While I strongly support doing away with the code test, I most

Haven't seen much opposition to this view except as straw men
produced by serveral pro-code-testing individuals.

SUBJ: IPS DAILY SOLAR AND GEOPHYSICAL REPORT
ISSUED AT 01/2330Z OCTOBER 1996 BY IPS RADIO AND SPACE SERVICES
FROM THE AUSTRALIAN SPACE FORECAST CENTRE
SUMMARY FOR 01 OCTOBER AND FORECAST FOR 02 OCTOBER - 04 OCTOBER

1A. SOLAR SUMMARY
Activity: Very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 70/5

GOES satellite data for 30 Sep
Daily Proton Fluence >1 MeV: 1.0E+06
Daily Proton Fluence >10 MeV: 1.9E+04
Daily Electron Fluence >2 MeV: 2.3E+08 (moderate)
X-ray background: A1.6
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
02 Oct 03 Oct 04 Oct
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 02 Oct: 70/5

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: Quiet to unsettled

Estimated Indices : A K Observed A Index 30 Sep
Learmonth 6 2221 1123
Fredericksburg 4 5
Planetary 5 5

Observed Kp for 30 Sep: 0211 2221

2B. MAGNETIC FORECAST
Date Ap Conditions
02 Oct 15 Unsettled to active
03 Oct 8 Quiet to unsettled
04 Oct 5 Quiet to unsettled
COMMENT: Field had mildly disturbed character after 21UT. Active
periods possible today.

3A. GLOBAL HF PROPAGATION SUMMARY

Latitude Band
Date Low Middle High
01 Oct Normal Normal Normal
PCA Event : None

3B. GLOBAL HF PROPAGATION FORECAST
Latitude Band
Date Low Middle High
02 Oct Normal Normal Fair
03 Oct Normal Normal Fair
04 Oct Normal Normal Normal
COMMENT: High latitude HF communication may be degraded during
local night tonight.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Date T index
01 Oct 1

Observed Australian Regional MUFs:
Darwin: No data.
Townsville: depressed 15% during local day.
Sydney, Hobart: near predicted monthly values.

Predicted Monthly T index for October: 10

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
Date T index MUFs
02 Oct 5 near predicted monthly values
03 Oct 5 near predicted monthly values
04 Oct 5 near predicted monthly values
COMMENT: Degraded HF comms may be experienced during local night
hours tonight.

Just found out that all this fuss about getting applications in on the opening day of gate 2 was a BIG waste of time. First in first out doesn't apply. It's a big "lottery" system (as it was described in a WWW page). All info is being entered into a computer and entries will be selected at random and their respective call signs issued. I thought I remember reading that calls were supposed to be issued on a first come first serve basis! But, then again I guess the saying, "I'm from the government and I'm here to help you" applies. NOT!!

> with adequate supplies.

Well, this is not entirely correct. First, a CW transmitter is a very simple device, easily repaired, specially if tube type and/or non-synthesized. Even in regular boating I have encountered bad microphones and the like, or the set sends carrier with no modulation.

If I was a radio officer on a ship, and out of port on the high seas I burnt out an irreplaceable component on a voice transmitter, I am pretty sure that in a day or two I could rig it up to work on CW. In fact, this happens often.

Now, should the boat be sinking, there is a chance to send a CW SOS. With call sign and everything. But if all you have is a voice-only rig, no way to key it, and don't know the code to boot then there is not much of a chance. These are not movie plots, because in 99.99999% of the time when the marine operator rigs up CW only capability, the ship makes an uneventful voyage and the needed spares can be obtained before the next sailing.

Makes a lot of sense for marine operators to have technical knowledge and know CW. However, money has reared its ugly head, and the american shipping firms do not want to pay several union salaries at maybe $70K - $100K each per year, plus benefits etc. So they dreamed up this GMDSS stuff, and are doing away with the morse code in a few years.

The coast guard did it sooner. In the older days, a lot of kids joined the military with ham radio experience, or just running telegraph wires thru the neighborhood. Nobody does that anymore, and it is a lot cheaper to buy ONE or TWO $10,000 radios than pay $300K each year for a properly trained operator. Under GMDSS, anybody (but usually the bridge crew) can get the GMDSS operator license. On board technicians are not required if redundant equipment is carried and an outside company does the maintenance. This is usually the manufacturer if they have a program for the boat to

return non-working gear in exchange for a working one. There is the option to take a GMDSS repair person, instead of spares and/or the maintenance/swap contract, but this person will probably be a $100K union salary. So don't expect to see many of them.

By the way, I am all in favor of NO-CODE testing. It is just that I like CW, am a CW man and would settle for continued c.w. subbands even if the test went all no-code.

Ramon, AL7X, Nome, Alaska

MIR operates packet on 145.55 simplex. You need to get a tracking
program so that
you know when to listen for them... they're not always active, or
sometimes they
operate voice instead. If on packet, connect to R0MIR-1 (note: R 'zero'
MIR-1).

Keep your message *SHORT*... not more than 2-3 lines probably. The
reason for this
is that the passes only last about 10 minutes max, and they are
CONSTANTLY being
hit with connect requests from other stations that will interfere with
your ability
to stay connected long enough for the message to get through. It is
best if you
have the message pre-prepared as a text file that you can send quickly
(ie, upload)
once you get connected and send the subject line. A beam antenna might
be helpful,
but isn't necessary... a good omni-directional can also work well.

The space shuttle has no provision for sending a message to it. When
you connect
to it (callsign W5RRR-1), you get the "robot" station that will issue
you a QSO
number and then are immediately disconnected. I've never seen the
astronauts use
packet for "keyboard QSO's"... but I suppose it could happen (don't hold
your breath
waiting for that though!). So the only way to send a message to the
shuttle is to
reach them on voice... and hold them long enough to read it to them. As

with the
MIR, however, it is very difficult to "hold them" for very long because
of the
numerous other stations on the earth trying to call them at the same
time.

Good luck,

Stan/KD9BE (unless I win the callsign lottery in Gate 2!)

DH> OE5AH Anton Hapsburg, former Archduke of Austria (SK)

Dave,
I am looking at a pre-WW II QSL I have from a contact with
OE3AH dated March 7, 1938 from Anton Habsburg, Archduke of
Austria. It is complete with the dual-headed coat of arms
of the Habsburg dynasty.

I don't think he would be known as "former", since that
was his title despite his uncle being deposed in 1918.

Note that the callsign was OE3AH, not OE5AH.

The import of the date of this QSO was his final operation
prior to the "Anschluss" of Hitler's takeover of that
country.

On the back of this QSL, as a teenager, I pasted this
newspaper clipping from a 1938 local paper:

Hapsburg is Reported Held.

Archduke Anton, Ileana's mate, May be Interned.

London, March 19--INS--An Exchange Telegraph dispatch from
Budapest tonight reported that Archduke Anton Hapsburg, husband
of Princess Ileana of Roumania, has been imprisoned in an
Austrian nazi concentration camp.

Princess Ileana, sister of Roumania's King Carol, fled Austria
and took an exile's refuge in Italy, the dispatch quoted Budapest
newspapers as saying.

The arrest and imprisonment of Archduke Anton followed discovery
of a secret radio station in his Sonneberg castle home near
Hollabrunn, according to the dispatch.

Austria's ruling nazis have apparently seized upon Archduke Anton's
long pursued hobby of short wave experimentation as an excuse
to strike at the ancient house of Hapsburg and the monarchist
movement.

The archduke and his brother, Archduke Franz Joseph, for years
worked together in studying and developing radio science. Both
are first cousins of the young Archduke Otto, claimant to the
imperial Hapsburg throne.

//

Interesting story from almost 60 years ago.

The ten year anniversary is unlikely to coincide with license
renewal. Does the FCC have the power to revoke licences for which
the vanity fee remains unpaid? Or will the FCC change the call to
one they judge to be less `vain' for free and for no fee at all,
after explaining to congress that such a change costs them money.

This program of rented calls is a can of worms.

If he can put a repeater on top of one of those high hills, then VHF or
UHF FM is the way to go. If not, HF/SSB on the 80 meter band will probably
work reasonably well via groundwave.

Not fair, Cec. You got your vanity callsign when Gate 1 opened. That gate was non-stressful for you since you knew you were going to get what you'd requested. But poor Randy - he can't sleep at night worrying, his wife left him, and his dog bit him. Give him some sympathy.

>Good point; I should have said "real time" QSOs. You get infinite bandwidth
>with infinite latency.
>

Properly designed digital systems will support many more "real time"
QSOs than CW in the same spectrum ... the only reason that the packet
systems *you've* been exposed to are so damned slow is that they're
poorly designed ... I'll bet you've never seen anything faster than 9600
baud (maybe only 1200) ... and the current store&forward system can get
bogged down for many reasons ... all of which could be solved ...

your "You get infinite bandwidth with infinite latency." statement does
not make sense ... nor is it

>The issue is: What if we quadruple the number of hams on the HF bands, all
>using SSB? Since they don't know CW, no suitable alternative exists, and
>have historically clung to wideband modes, why should we expect anything
>different to happen?
>

Well, gee ... you might actually have to SHARE "your" band(s) with
someone else. How DARE anyone propose such an outrage?!?!?!?

Seriously ... you'll have to learn to share ... and adopt/develop new
modes and techniques for sharing ... the world won't end ... it'll
actually get better ...

You CANNOT stay in the past forever ...

It is not the government's "job" to "see that CW continues until
(anything) ..."

And suitable replacements are ALREADY available ... the people in the
commercial services have been using various forms of them for decades.

Only hams continue to cling to the past by insisting on CW ...

Even MARS has abandoned CW ... banning the use of the mode starting on
October 1st, 1996, I believe ...

Hello? Is anybody home? Wake up!

>level where a choice must be made. Current HF enabled licensees have a
>large sunk investment in Morse wetware conditioning. They are reluctant
>to discard that while they can still get marginal utility
>from it.
>

I understand the latter part, but disagree with the first part ... due
to the wetware conditioning, it takes longer to effect change ... there
is considerable resistance to ANYTHING that looks, feels, sounds, or
even smells like it might be modern and progressive ... in order to
overcome this inertia, we must begin applying pressure now ... sort of
like the concept of ion propulsion ... force applied over time will
eventually cause significant acceleration ...

>>>Susan Ness is correct. We can accomodate arbitrarily many
>>>amateurs on HF if we use techniques better than the ones
>>>we use now.
>>
>>I would suspect that the Hon. Ms. Ness only knows that because some

>
>While I do believe you are correct that Commissioner Ness is
>a lawyer rather than an engineer, you must also realize that
>she has a different objective, a different metric in mind,
>when she looks at spectral usage than current amateur licensees
>have.

That's EXACTLY the point *I've* been *trying* to make ... we HAVE to
understand HER agenda and HER metrics or we're screwed from the start.
The things that we presently have to offer will NOT stand up to the
commercial interests in the future ... we have to modernize and grow in
order to be able to stand scrutiny under HER metrics ...

>She is charged to maximize spectral value in the public
>interest.

And we won't measure up very well right now ... and if we don't change, it'll only get worse in the future ... the old guard may not like or want to accept this reality, but reality it is ... sticking our collective heads in the sand is suicidal, 'cause the commercial interests will come along with one of those big, gas-powered "weed-wackers" (the kind with the steel blades, not the light-weight kind with a stupid nylon string) and wack us off by our scrawny necks ..

>Amateurs are primarily motivated to protect their individual private
>interests. For the most part, that oftem appears to them to be best
?served by defending the status quo rather than embracing more
>spectrally efficient methods of communicating.
>
This is, obviously, EXACTLY THE WRONG COURSE OF (in)ACTION ...

>Entrenched interests fear change because they aren't sure what
>their place will be in the new order. Thus they tend to vigorously
>defend the status quo. Only a relative handful see change as an
>opportunity rather than a threat.
>

Everone better start seeing a LACK of change as a BIG threat ...

>You must consider that if we were to demonstrate that we could
>use our spectrum more efficiently, and if we then didn't have
>sufficient numbers to fully occupy it at that higher level,
>we'd risk losing some of the spectrum we have warehoused.
>
>As long as the bands appear full, to the naive who don't know
>there are better ways to use them, they look safe. Unfortunately
>for the naive, the Commission appears to be discovering that
>there are more efficient ways of using spectrum.
>

EXACTLY ... they're becoming aware of that ... and demanding the end of the status quo ... enacting tougher spectral-efficiency standards for type-acceptance of Part 90 (land mobile) gear shows that they're serious .. they'll cause the Part 90 folks to replace their gear ... that's $$$. Too bad ... more demand=use it more efficiently ... that will apply to us, too ... don't bitch and whine "it'll cost $ to buy a new rig" ... they won't care ... whining about it when they're requiring the commercial folks to upgrade will simply piss them off ..

>If we want to keep the bands we have, it seems to me that we
>must first increase numbers to such an extent that amateurs
>will voluntarily adopt more efficient methods in order to cope.
>That keeps our spectral occupancy high while at the same time
>showing we're willing to use what we have to best effect. If
>we don't do this, we may find a Part 90 style solution imposed

>on us, and then find parts of our bands taken because we aren't
>occupying them fully.
>

There's NO reason that we can't be AT LEAST as spectrally efficient as
the Part 90 folks ...

[snipped the remainder ... I agree with it, without need for comment]

Joe,

Relax ... as one who has designed comms gear for DoD, I can assure you .. When the "fit hits the shan," properly designed hardware and software will out-survive and out-perform Morse-conditioned wetware ... despite the old-timer's fears and doubts ...

>

But the pro-coders keep insisting that it should be maintained as a
requirement because of its alleged popularity ... that's the rub ...
that's why I pointed out that its popularity, or lack thereof as the
case may be, is irrelevant with respect to its continued suitability as
a licensing requirement ...

>>>Thousands of hams throughout the world enjoy conversing in a "language"
>
>>It's NOT a F___ing language!!! It's ONLY an old, inefficient means of
>>encoding text into on/off keyed signals. NOTHING MORE ...
>
>Sure it is a F____ing language.

Is NOT ... it's ONLY a code ... I can encode ANY _language_ that uses
the same alphabet (English, French, German, pick one) in Morse ...

>But only to those of us who *understand*
>it..... Chinese is a language to people in China, but not to me. To me, it's
>just noise.

I understand Morse ... it's STILL noise ...

>Sounds like geese F___ing.

Sounds like Morse to me ...

>But we can't make all the Chinese people in the world speak English just
>because I don't understand Chinese, can we Carl ?

So why make all hams learn to "speak" Morse, just because you don't
understand English???

?And we can't make
>all the hams in the world stop taking CW tests and using CW just because you
>don't understand dits and dahs......

>

OK, here's a deal ... we'll make the Morse test *optional* ... doesn't count for squat, but *you* can take it if *you* want to and if it makes *you* fell good ... but nobody is *forced* to take it ...

To do otherwise is EXACTLY the same as to "make all the Chinese people in the world speak English just because (you) don't understand Chinese" and you already admitted that that wasn't fair ... (gottcha)

>Doesn't matter who likes
>it or doesn't like it, as long as the FCC thinks we need to take CW tests,
>those of us who want to get on HF will continue to take them.
>

That's EXACTLY why we're debating the issue here ... because we want to get the rules changed and we're trying to educate people to why they should support that idea ...

Even though the cost to some of us is over 500 times higher (AND COUNTING!)
compared to those who have an aptitude for it.

> That is effectively an artificial subsidy to Morse, just
>as a protective import tariff is a subsidy to inefficient domestic
>manufacturers, and makes the competition uneven.

It does indeed.

>Without that subsidy, I think you are correct that Morse would,
>if not become extinct, at least become much less used.

It may see more use rather than less. The people who can learn it quickly
will still be attracted to it, and that will include a number of people
who would never have become hams if they had to learn it up front.

>I would not be surprised, or disappointed, if it became like AM, something
>people tinker with only for nostalgic reasons.

I believe this is already the case.

A question about Vanity Callsigns... When you pick a callsign, do you have to use the region number that you are in? For example, I am in California (region 6), so do I have to choose callsigns like K6JKL, W6JKL, N6JKL, etc.
Can I choose other region numbers, like K9JKL, W5JKL, N0JKL, etc..

If you know the answer to this question, please post in this thread so others can read it as well.

But reality has shown that there hasnit been
a single amateur radio case such as you
would want all HF hams to be ready for
in years... 5 or more at least.

>I'm not against FSK either, and I'm definitely pro-digital.
>All I'm saying is that there can be situations where
>hand-keyed Morse is the only means of getting out!

Then why make only HF hams known code? Is
such a situation more likely on HF than VHF?

>You're comparing your uP-based FSK decoder to
>a transceiver. That wasn't my point. What I was
>saying is a one-transistor circuit could operate
>as a CW transmitter and receiver in an emergency.

Again, it just doesn't happen that way anymore. It
is not at all justifiable to mandate CW knowledge on the almost
infintesimal possibility that it may save a life someday.
We'd save more lives if we just required all hams
to know first aid and/or CPR.

oh, you poor misunderstanding man...our day is just not complete until we've
beaten the code test discussion to death again.

>I mean the ITU and FCC have the final say so on
>this matter.

well kinda. may i suggest reviewing the literature of the late 1980's to
see just how the code free ticket rules came about. i believe you'll find
it to be a grass roots movement. in particular, review the ARRL's proposal and
compare and contrast to the QCWA proposal that was pretty much accepted
for the way to go. the FCC is an agency of the US government and has
procedures for petitions to change the rules, y'know.

>We can yell and scream and do like in the olden days

Great idea. That sounds JUST like what we are doing now. When's
the last time you were heard about some being dragged out of their
home, kicking and screaming, and forced to take a CW test ? Morse
tests ARE optional NOW. Nobody HAS to take one. Those people
who want higher class licenses and more privledges have the OPTION
of taking CW tests right now.

>To do otherwise is EXACTLY the same as to "make all the Chinese people
>in the world speak English just because (you) don't understand Chinese"

>should support that idea ...

OH, I C. This is an EDUCATIONAL process that is going on here. People who
have NEVER been on HF, and people who have NEVER HAD A HAM TICKET
are EDUCATING those of us who HAVE been on HF for years about the
best way to use HF. That sounds like a WONDERFUL idea. Maybe tommorrow
I'll find someone who has never played golf and ask them to take me to the

driving range and give me a few lessons.....

But anyway, Carl, stop educating, start petitioning. That's the only way to get the job done.

>better linears. So yes, the percentage of morse users will be reduced
>thereby.

And where would these millions of people come from (even if we look at the situation world wide) ? I doubt that large hordes of people from the street would be interested in HF-communication, while many other forms of communication are available. I guess that most people that would be interested are currently hams with only VHF/UHF license, CB operators and SWLs. Only a small partition of these groups would be affected. A large number of people from these groups that would start to use HF bands, would mainly be interested in chating with local friends (with whom they have more in common). This would no doubt increase the use of SSB on the 75/80 m band, but fortunally the (day time) propagation on this propagation is geographically limited. The minority interested in DX-contacts would, no doubt, learn CW or invest in other digital means of communication.

In any case, it is very hard to imagine the same kind of new hams on HF as the CB boom in the 70s. One contributing reason for the CB boom was that CB was the only means of mobile radio communication available to the general public in those days. Today, ham radio on HF is not the only means of worldwide or local (fixed or mobile) communication available and IMO there is not a risk for a huge number of new HF ham operators even if the CW requirement would be dropped or made easier.

>I see the removal of the testing requirement as a further lowering of the
>entrance requirements for ham radio.

I do not see the problem in lowering the _entrance_ requirements, provided that the privileges are adjusted accordingly. Thus, I find it quite strange that the U.S. Technician license allows operation of 1.5

kW transmitters with very limited technical knowledge.

OTOH, the full licence should be much more demanding than the entrance licence to operate high power transmitters and use bands shared with other services.

>If the theory and math tests are
>made more difficult to compensate, then we'll have more engineers and
>fewer non-technical trades and professions in ham radio, and I don't see
>that as necessarily a good thing.

I do not find that the _ratio_ of technically minded hams vs. non-technically minded hams as a a problem, the important thing that the absolute number of hams with technical background is sufficient to maintain the vitality of the service.

>Besides, why would the tests need
>stiffening, if the morse test requirement is dropped?

Stiffening the requirements after the morse requirement is removed is the same as admitting that today the other requirements have been too easy and that those that have received the licence in the past are not fully competent to build and operate an amateur radio station.

Well, CArl. Here I have to take issue with you. I am a cw man, and
I enjoy. So do thousands of hams. Lets not impose our likes and
dislikes on others. You don't like CW, but like digital and voice?
Fine. Don't operate CW, but don't dictate to me that CW is obsolete
and needs be done away with.

I am not sure of the obsolete part, but I do agree that there are
lots of perfectly suitable substitues....yelling into a mike being
the most notable one.

I am totally in favor of eliminating CW from the exam, but **not**
the CW subbands (they could be smaller, though). Think about this
a minute.

You would have a license class or two, both with no code. That's it.
The big license has a no-code test but allows full privileges on
the bands. However, the bands would still have divisions for
CW, digital, voice, sstv, no-fm (weak signal vhf), beacons, etc. etc.

The reason we have sub bands is that one man's cup of tea is another
man's poison. It would probably get you ticked off if the CW people
proposed doing away with phone for "being wasteful of spectrum space!"

Amateur radio is a hobby, engaged in for personal reasons, mostly
for enjoyment, even as it might fullfill, once in a while, a public

service or educations aim.

Thus if I want to operate CW, I should be able to do so without getting abused by phone guys, and the phone guys should be protected from digital noises, and the meteor scatter guys from the fm'rs, etc. The sub-bands can be adjusted periodically by gaging the degree of use which they receive. I have no problem with that. In the year 2020, when I am ready to croak from Alzheimers, the CW bands may be just 10 or 20 kHz.

I just don't think that it is fair, in this day and age, to impose a test on a non-essential item.

How about a written test with no questions on voice emmissions? This is a different deal. Here we are talking about a TECHNICAL exam, a written test, not an ability test. I think the technical portion of the exam should cover all modes, perhaps some more deeply than others. The idea being that the prospective ham has shown that he posseses the technical ability to build, repair, adjust or just understand and operate his gear. I think the present test for General and up are probably adequate (I am a VE).

Most hams operate phone, and virtually all prospective ones do contemplate phone operation, so the exam should concentrate on that.

Not only from the technical perspective, but also should ask about operating procedures, the phonetic alphabet, amateur lore and tradition and on-the-air etiquette. This all besides some theory so the guy can recognize and understand the principles involved and recognize TVI, improper emmissions and the like.

Like I said, the present test is close to adequate.

But CW ability should not be required. Heck, the FCC doesn't put you in front of a mike and check your voice out. What if you are one of those that freezes in front of a mike? Specially with an audience? Anyway, you get my point.

Ramon, AL7X, Nome, Alaska <<-- Out with CW exam. Retain CW bands!

you are not limited to the call region (0 thru 9) and can get a call outside
the region you live in. which will make the qsl buro for each region real happy

BUT!!!! you are limited to the callsign within the 48 states. In other words
you couldn't get the call WH2O as that is not within the continental US
but you might be able to get N0CW

DROP THE CODE DROP THE THEORY!!! NOW!!!

> Am I too optimistic, do you think?

I think you are on the right track. As a matter of fact, I believe
the ratio would change slowly and eventually CW might die out or
be reduced to just a few kHz sub-band.

I am a CW man, enjoy code but cannot see what use is testing for
morse code ability anymore. Hey, the FCC did not give me a test
on giving speeches on a microphone to an audience (lots of people
freeze). If they allow you to use voice on the radio without
a speech test, why test for code? Makes no sense. It is
obsolete thinking.

What I want to see is all licenses be no-code. Carl proposes just
one class, I think two would be better (a basic test for limited
privileges as an entry point, then the full ticket).

However, the cw sub-bands would be retained (actually created so
we don't get clobbered by the digital modes as they grow). The
hams that know code can operate CW or not as they see fit. The
no coders....some will learn the code on their own and join the
fun on 14005.

While I strongly support doing away with the code test, I most
vehemently oppose any elimination of the CW mode and sub band
accomodation for it. This only makes sense.

This assumes that the minimalist factor of Morse code transmission and reception makes it the overwhelming choice of mode of communications for amateur radio. Aside from the fact that it is in the process of being abandoned by all other services outside of amateur radio, what is it about Morse code that one must demonstrate this skill prior to being authorized to use the amateur allocations below 30 MHz? So far the only arugments that have been offered is that it is traditional to demand such testing, the mode should be preserved because it is indeed the simplest mode; or it is a method to minimalize the number of radiotelephone operators. There are others, but they don't stand up to scrutiny.

Excuse me? Morse really believes that while a ship is in distress, he would undertake to save the ships' crew and passengers by sitting down and making a one-transistor TX ignoring the fact that the ship would have on-board automatic alerting systems, let alone the digitally based distress and safety alerting apparatus? Somehow, I doubt that the ship's crew would be more likely to ensure Morse's personal safety, than to let him contruct his transmitter. Even if this were not the case, what would Morse propose to do for a reciever? How would he be able to ascertain his position for the

purposes of informing search and rescue? Where would he get his power? Would he have been carrying batteries in his waterproof battery carrier when he came on board?

So, Morse supports the continued testing of Morse code even though vessels will no longer carry Morse code operators. Regardless, there is no evidence that amatuers have used Morse code for communications with ships in distress. I can only assume that Morse would support Morse code not just on the remote chance that this could be used in a distress alert, but on the even more remote chance that there will be onboard an amateur who, during this emergency, undertakes to build a transmitter and receiver, the availability of parts and power is highly questionable.

Jim:

The program was indeed long in coming, and after it surfaced some serious problems were identified that did require require ARRL, and certain other amateurs, to petition the FCC for reconsideration. The most noticeable change that came from the ARRL petition was the protection of certain Alaskan, Caribbean and Pacific region prefixes where an applicant did not declare an appropriate mailing address in those areas. Another reconsideration period occurred again after that, but ARRL was not a part of it.

As for the higher dollar amount ARRL was considering early on, at that time the FCC published fee for Vanity was $7/yr or $70 up front (rather than the $3/yr $30 up front we have now). And, or course, 10 years from then at the first renewal we may have had to pay $70 or no doubt a higher amount--and again at every ten-year renewal interval after that. So, at that time, our suggestion was to have the up front fee be a larger amount--and that it be a ONE TIME ONLY FEE, never again to have to be paid.

Of course that issue is moot now...and the fee is $30 up front, and $30 or more every ten years.

The above statement may be valid to Carl The Freedom Fighter, but
to me it sounds like bunk. Sure, SSB displaced AM. But one's and
zero's aren't anywhere near displacing dits and dahs.

Gary, you are in the testing business, so how about we do a little test.
You mentioned you use Pactor or Clover, I forgot which, maybe both.
And you said above:

>>>Amateurs can certainly continue to *try* to use their older
>>>modes of choice, but it will become increasingly difficult to do so.

My 'older mode of choice' is CW. I don't think it's very difficult at all
to make CW contacts on the ham bands. My favorite number is 500.
So how about you give me a date and time to start the test, you make
500 contacts with 500 different stations on Pactor, Clover, whatever,
and I'll make 500 contacts with 500 different stations on CW, and we'll
both post our logs here and see who had the most 'difficulty' completing
the test. To make things interesting, let's allow the use of all the HF
bands. Run what you brung. No need to make 'quality' contacts, just
make contacts - pretend we are both in the middle of a large disaster
area and we are crying for 500 people to come help us. If we can exchange
signal reports, we can talk for a half an hour, no need to bore the world
with our little test. If 500 is not a good number for you, make it a thousand
or whatever. You know more about testing than I do. We could even post
the logs on a daily basis so eveyone can see how we are doing.

Wanna Play ? Here's you chance to show the world how well your digital
stuff works and make us old fartz look bad.

Your interchanges about CW are the only ones worth reading. Intelligent, concise and productive.

My contribution to all this is quite simple. I strongly advocate a graded license for the simple reason that not all who enter amateur radio do so for the same reasons. Some like 2m, some like DX, some like CW, some like it all. So the graded license is important to a) grant access to some bands , and b) preserve full access to those who fully use it.

CW's death has nothing to do with its involvement in amateur radio. No more so than tubes were replaced by transistors because tubes were dropped from ham sets. CW died by itself, like everything else over time. This doesn't negate the fact that it is still the simplest form of communication. Turning on/off a xmtr. No mic, no amps, nothing. Crystal (galena) radios are still in use today and are still being made. They are a riot. Obsolete, sure, who cares.

I enjoy CW and use it. Wish I could go faster. Its inclusion in the license, however, could be better replaced with another test more effective (and fair) for granting right-of-passage to full bands. Full bands shouldn't be accessible to everyone just for the asking, it should be worked for, a bit like money.

>get the dynamic range I want, presently only 48 db (though I
>have 30 db more in software controllable gain in the codec).

I am a bit puzzled, since I assume that a linear 16 bit codec is
used and the signal to error ratio improves with about about 6 dB/bit,
with 16 bits you get 98 dB (6.02 db * 16 bits + 1.76 dB) of signal to
error rate. That 48 dB sounds like an 8 bit ADC.

>But as noted above, that won't remain a problem much longer.
>And just as well that I'll be going to separate converters
>because the stereo codec I'm using now only has 80 db of
>channel to channel isolation, and that's not going to be
>enough when I go to 24 bits.

With 24 bits you get 146 dB SNR. In direct sampling of the RF signal
this would be very desirable, but do you really need so much dynamic
range in the I/Q system. You have to have some anti-alias filters
between the I/Q mixers and the ADC and with this you gets rid of the
problem of very strong signals with an offset more than 20 kHz from
the desired signal. If we assume 300 K antenna temperature (-174
dBm/Hz) and 20 kHz anti-alias filter bandwidth, the equivalent antenna
noise power is -141 dBm and with 146 dB SNR, the maximum signal would
be +5 dBm. On HF, the antenna temperature is several order of
magnitudes more than this and thus the dynamic window can be shifted
upwards allowing maximum signals in the order of 1 W within the 20 kHz
passband. In my opinion, it is not realistic to design ham gear for
such a specification. A 16 to 20 bit system would in most cases be
sufficient, with a great reduction in cost.

>I will need a DSP with wider registers to handle 24 bits,
>and a faster clock wouldn't hurt, I'm running out of
>processor cycles. Fortunately that exists, but it is still
>a bit expensive.

It is allways nice to have some extra bits in fixed point arithmetic
to store the intermediate results. Wouldn't the 24 bit 56000 series
from Motorola be sufficient if you limit the ADC to 16 to 20 bits ?

> serve as a barrier against the millions of new hams I mentioned.

Well, I fully support the no-code idea, even if I am an extra class ham and a c.w. man (besides the local repeater for chit chat with the boys).

The exam does need some strengthening. I am a VE so I know whereof I speaketh. But it does not need strengthening in technical matters; I thought the written for codeless technician to be fairly wide in scope and depth as a technical test.

No, where I think it needs strengthening is in operating practices; things like radio etiquette, radio lore, perhaps some history and tradition; good operating (no lids, no kids...), etc. Many hams today, quite a few with extra class calls, are doing nothing but yelling, shouting and using apalling language on the air. 20 meters is often a zoo.

We need to get these zoological creatures off the air, and perhaps a written test that addresses the issue better might be the way to "stiffen" up the ham radio written exam.

You know, its a funny thing, but if you just operate voice modes and SSB, and the ham on the other end is visiting at an extra class shack and using the extra call -- which is okay if the extra is on the premises -- I bet you can't tell the difference between a no-code guy and the real extra class. Being a good operator is matter of good taste, courtesy and willingness to help the other fellow. Some knowledge and experience help a lot, of course, but I think it is soon enough acquired.

However we have to straighten things out a bit, or pretty soon a whole new generation of hams are going to have as their example, not the good operators, but the zoological creatures that seem to be invading the bands.

One nice thing about CW is that the people there are usually much more gentlemanly.... perhaps because it is such a pain in the arse to pound out insults and foul language on a telegraph key.

By the way, my counterproposal to the whole argument is: eliminate the code test from ALL amateur class exams, but KEEP c.w. subbands. If digital modes eventually start stomping on the c.w. guys, then I

think a small band for just HF (and weak signal VHF) CW would be in order.

Just think, a guy gets his no code license, which theoretically allows him to operate on 14,005 kHz. But he does not know the code, so he stays in the zoo area. Maybe a year later his appetite for cw gets whetted, and he learns it....5 wpm at first, but at least he HAS it. Now he can fire up on 14,005 and participate, and in a couple of months he would be up to snuff with the rest of us. That doesn't sound too bad, does it?

I just don't see why passing a code test is neccesary for the folk who dont want to use CW, or even, why take a code test at all. After all, you wouldn't want to fly a plane unless you knew how!

And....the FCC never game me a speech test, or require me to address an audience over a PA system thru a microphone, yet they allowed me to operate voice modes. Seems a bit incongrous, now that I look back on it.

4197. Vain CW op Calculates

Newsgroup: rec.radio.amateur.misc
Date: 1996-10-02 00:00:00 UTC
From: Larry Deering <ldeering@haven.ios.com>
Message-ID: <3252786F.7497@haven.ios.com>
Source record: 215560

The wait for Gate 2 results lets us rethink CW, bandwidth, etc. For instance, the number of applications on day one is roughly 4000. If the FCC typist is actually one CW op running 20 WPM, how much longer than three weeks (the estimate to input all of the calls) would it take?

Each form has the current call, and 25 requested calls, for a total of 26. If you assume each call is a word, that's 26 words per form. Of course, the requested calls tend to be very short (N2EE vs. KJ0QJY for instance!).

The time for one CW op @20 wpm = (4000*26)/20 minutes, or 5200 minutes, or 86 hours 40 minutes, which is two work weeks and a day.

A real cw op would be faster of course, sending the same 1x2 calls over and over again.

sigh!

Well, I do not think c.w. is dead, but the QRM level *does* seem to
be down a bit!

Remember, in the old days, mostly home brew gear (I used to build
all my transmitters but had no real luck with homebrew receivers),
it was not easy to get on phone. The a.m. transmitter, and later the
ssb sets were much more complicated and expensive to build. Voice
was considered the mode for the rich, or those with building abilities.

Today, of course, you can buy a brand new HF ssb set for under $900.
That is not much money, maybe 2 to 3 weeks of wages for a guy. I
recall when nice sets like Viking-II's, World Radio Labs 300 watt
sets, etc used to go for $600...$700 and the Collins KW-1 were over
$2,000. In those days, a grown man earned maybe $250 - $1000 a
month, with about $500 being average (1960). Thus such a transmitter
would run two months of wages and did not include ssb, a receiver,
or even a v.f.o. in the price!

I do not think that phone, be it ssb or f.m. is in any way today
considered an "elite" mode for the rich or technically minded.
In fact, CW is rather the "elite" mode, because all no coders stand
in awe when I fire up and operate on 14,005, or some other nice
low end spot, and chat at 20, 30 wpm on c.w. and write out the qso
in nice lettering on a yellow note pad. Quite a few are interested...
not that they will commit to learn the code, but at least they seem
to recognize the usefulness of the mode. Many are amazed at the

amount of information that can be sent on moderate to fast c.w.
with proper procedures and abbreviations.

The same difference is between a phone call and a letter. The
phone call is the no brainer, but the letter takes some organizing
of thoughts and leaves no doubt about what was said. In many cases,
e-mail or a snail mail letter is a faster means of communications,
even if it is not quite real time!

As to license classes, I too see a need for graduated or incentive
(pardon the french, is "incentive" a bad word?) licensing. But
I do not think the multiple classes we have today are really
neccesary. Nor is a separate license needed for every mode and
interest.

The license is there to separate the wheat from the chaff. It is
what guarantees that the person has some comitment to the hobby, for
the hobby's sake. Not just a guy with enough money to buy a radio,
but someone who goes beyond just the instant gratification. I think
a proper written test can do this.... in fact, it does not have to
be terribly technical, I think a *lot* more emphasis should be put
on good operating practices, etiquette, radio lore, etc. Then we
get good operators (or we hope we do!).

As for the guy being technically minded, not even the FCC expects
an extra class ham to be able to build a synthethized ssb transceiver.
It takes some masochism to do that -- and stay under the Japanese
price!

What is wanted from a technical test is to be able to insure that the
guy can recognize proper set operation when he sees it; and that he
can competently use the radio in a legal manner. And if things go
wrong, like TVI, RFI, harmonics, etc. he can recognize it, and be
able to do something about it.

There are lots of people that drive cars but are not mechanics.
Lots of people that fly airplanes, but are not aeronautical engineers.
And lots of people play golf, but they can't build the balls!

The question is, does this lack of knowledge create a hazard? Consider
the automobile. Say your brakes go soft, or the brake pedal goes
almost to the metal. I think the point is: a driver who is not a
mechanic should be able to recognize that he has brake problems and
stop the car, or drive to a garage and have it checked. But surely
he does not need to be able to delve into the brakes himself.

So I think the test should have that sort of perspective in mind.
Sure, technical knowledge is required, after all, ham radio is a
technical hobby. In fact, if radio experimentation is to your liking
(it is to me), then you will soon be a radio tecno-nerd building
spread spectrum gear or bouncing signals off the moon. But a lot
of people do not have that inclination, and do something else with
their ham tickets. This is not bad. However, I think that ALL

hams should have a rudimentary knowledge of what is AM, FM, SSB, CW, meteor scatter, tropo, propagation, moonbounce, weak signal VHF, etc. I don't mean to give a test on how many db gain it takes to bounce a signal off the moon, but they should be aware that it is a mode that can be used by those interested in it, and that it needs some quiet spectrum, etc. With this knowledge comes respect.

Respect means that no one gets clobbered by planting an FM repeater smack dab in the middle of the moonbounce, or some such monstruous thing as a warbling teletype on the middle of a maritime ham ssb net.

I envision a 2-step license. The first one should be something to tempt the new guys. Give them a fairly simple test, somewhere between novice written and technician, with the emphasis, I think on good operating practices and non technical issues. But enough theory to recognize problems and be able to more or less set things up with only a bit of help from the Elmer. This license would grant limited privileges. More on this later.

The upper class license would convey full amateur privileges, that is, all modes, all bands, highest power, etc. All radio hams now having say a General or Advanced and up could grandfather into this, in fact, maybe even the techs and the tech pluses. I have no problem with this.

Reason being if a guy can pass the general written, it does not really take much more to pass the extra class written. And really, if a guy can operate on 20 ssb with a general license, the only reason for requiring an extra for another part of 20 ssb is that the powers that be decided it to be so. Otherwise, if the guy is NOT qualified to operate 20 ssb, he shouldn't. To me that indicates that a general class licensee is deemed competent to operate on 20 ssb, and any limitations to narrower bands seem to be just prejudice or part of the "good old boys club".

So, what privileges to grant to the entry level license? Well, I think someone can get hurt by high power, high voltages, maybe even get his brain or eyeballs fried by the electromagnetic r.f. fields. So obviously, this license should be for much lower power than 1.5 kw.

It seems to me that the power level that is consistent with no real hassles with the above criteria is the 150 watt transceiver size sold by the Japanese. However, a good argument for lesser vhf power can be made, perhaps in the interest of TVI, or r.f. radiation biological hazards. In this regards, the Japanese vhf or dual band rigs seem to top out at 50 watts, with a few minor exceptions. This might be the power level chosen for this license on vhf and up.

After all, we don't want our newcomer to get swamped by TVI complaints before he knows more about the hobby!

What about bands. Well, I am completely at your mercy here. I think all vhf and up bands, of course. Then maybe some HF, for

sure 10 meters and 160 meters. The rest, could be something like full privileges except the low power on 40, 30, 17, 15, 12 meters. Perhaps some limitations on the frequencies available for 80/75 and 20 meters as these bands are crowded. Note too that 30 meters is currently c.w. and digital only, so the no code newcomer would have operating privileges there, but he must use code and digital. Likewise on the c.w. sub bands. So the guy is faced with the fact that he is allowed to operate on 21,020 kHz, but he must use c.w. there, and to do so he better learn it on his own 'cause the FCC is not going to make him do it!

Now, the numbers I threw out above are just figures done without much meditation on the matter, but you get my drift... This entry level license would be VERY useful, yet will keep the new guy out of trouble with neighbors, allow him to get experience on HF -- even CW if he wishes to master it -- and yet not add significantly to the 20 meter SSB QRM.

It would, in fact, provide the incentive to get the final license.

I foresee a lot of people going for this so they can chat locally, participate in repeaters, fox hunts, and run around with the local ham club guys (ham clubs could well get a resurgence from this). The HF privileges are good, and may be all he ever wants, paticularly if he a sailboat guy traversing the ocean, etc.

Now comes the matter of how do we accomplish all these noble goals?

Well, there has been a lot of complaining that Carl and his internet postings are hot air, with no specific proposals. Well, if I was Carl I would be faced with a bit of a problem.

That is that the FCC will turn down the petition for no code HF license of any type because it is not in accordance with international treaty. Note that there is provision for countries to exempt themselves from this requirement -- like Japan with their HF 10 watt license -- but it must be done by Congress (or is it the Senate for treaties?). The FCC is powerless in this regards; however, at the international conferences they could present the views of the current U.S. lawmakers.

So the three avenues are: (1) Change the treaty or the Geneva rules so that code is no longer required or is up to the individual country's administration. (2) Don't change the treaty, but get the Senate or Congress to instruct the US ITU delegation to notify at Geneva that the US exempts itself from the morse code requirement. (3) Note that the requirement for code, by international obligation is merely to know the code, no speed requirement is. I am pretty sure that if you just memorize the 26 letters and 10 numbers and be able to answer questions on the written as "What is the dot-dash pattern for the morse code letter 'M'", and the 4 multiple choices follow, it would probably be okay legally. THIS could be done at the

FCC level.

On thursday evening I have a meeting with Senator Ted Stevens and probably Rep. Don YOung. The meeting is for enlightened Republicans and folks active in party matters (I was a delegate for the State Convention). Maybe I can make a mention, but if the gentlemen just don't know anything about ham radio, morse code, then I will drop the subject in favor of writing a letter which can be processed by their staff. And surely the ARRL will hate *this* life member for it! Mind you, I don't think that I have the right to force a change in the rules. Present system works, and lots of hams will not agree to it. However, it needs to be considered. We need to start some dialog among hams, no coders, ARRL, FCC, and proceed along official lines.

The way it is now the FCC slams the door in your face "its a matter of international treaty". The ARRL puts out a "Survey". But this survey was taken of ARRL members, which although it represents a large portion of the ham population, is actually a rather distorted representation of it. I think most ARRL members are people that are pro-ARRL, participate in ham radio politics like Director elections, etc. etc. I think a lot of little guys are being left out, specially young ones that would rather take a girl out on a date or buy a gadget for their ham shack than to take out a membership in ARRL. Sure, QST is a better deal when a member vs buying at a newstand, but you CAN afford a QST at the news stand, while the membership takes some real dollars, the accumulation of which is agains all teenage principles!

So, from the far north of Alaska, where we are getting snow, ice and abominable snowmen....not to mention a pretty girl behind EVERY tree here in Nome, I bid you adieu, and 73.

Ramon. AL7X, Nome, Alaska. Ham since 59, extra '62, ARRL VE.

Well, since I was a Republican delegate at the State convention, let me set the record straight, and I think this is pretty bipartisan, just history.

The Republicans demanded Clinton sign an agreement to do the budget cuts or he would not get the continuing resolution to fund the federal government. Clinton refused and Clinton, not congress, mandated the government shut down. He had the option of continuing to run it on reserves, but he did not.

On the other hand, if I was Clinton I would have done the exact same. After all, it doesn't take a rocket scientist to figure out that no one is going to sign a paper agreeing to a budget, when the budget has not been turned over to Clinton to look over. How in the heck that Newt and his cronies figured it was remotely fair, not to say utterly stupid, to complain about Clinton not agreeing when Clinton did not have the damn budget? Or the Republican's final 2002 deal?

This is where Clinton gained the moral high ground and it looks like he is going to have it thru Nov. 5. Personally, I think Dole would make a fine president, and I suspect Clinton will break many of his promises, but never mind. There is no way that Dole is going to win this election, thanks to an utterly stupid jump-the-gun act on the part of congress.

What uncle Newt should have done is give Clinton a continuing resolution for a couple of months, like Clinton and Pannetta wanted, a clean one, and then when the budget is finished, present it to Clinton and say: heres the budget, sign it, or give us an acceptable counter proposal or take the consequences when the continuing resolution expires. This way I think the Republican congress could have kept the moral high ground, and, lets face it, it would have been fair. The consititution says Congress passes and prepares the budget (in fact, I think it says the HOUSE).

But the way it was done, even I, a true-believer in the Republican truth and light was totally apalled. I won't even mentioned the shenanigans at the State Convention. Even more apalling. Which I might bring up Thursday Oct 3 meeting with Sen. TEd Stevens here in Nome.

But I am sure there are a lot of Democrats out there with horror stories about their party too.

Hey, this is supposed to be about ham radio! Hope you get your call. I hate mine. AL7X sounds worse than my handpicked one KL7FM years ago when us extras could pick our call and before the creation of 2 x 1 calls. But all the guys here in Nome tell me to keep AL7X instead of reverting to KL7FM (which sounds great on CW!). So I didn't file for gate one (former call) like I could have.

What do you think about my call? Should I keep AL7X or go back to KL7FM ??

Ramon, AL7X, Nome, Alaska

Well, one nice thing about the ARRL is they move slowly, carefully,
and never seem to take rash actions. Hurrying up ends up in
mistakes that stay with us for a long time. Like the 11 meter fiasco
where the FCC moved fast.

Latest fast move: Clinton signed a budget that will take in $23
billion dollars from "spectrum sales, mostly to broadcasters".

Bet you dollars to donut holes that guess what frequencies are
going to be sold to whom, when?

Right on CArl, and the new budget deal between Clinton and congress
balances the budget (or reduces the gap) partly from $23 BILLION
dollars to be raised within the next two years from the auction of
spectrum space. Guess who is liable to get their spectrum sold
out from under them?

If not this time, come two years when the politicians have given the
money to foreign aid and welfare, they will come back for another
round of auctions, and another round.... until the FCC has no more

spectrum to auction off.

The answer is not necesarily how efficiently we can use the bands, but actually how many hams we have in the ranks, the rate of growth, whether it is stagnant or not, and the amount of money generated into the economy by radio manufacturers. Like it or not, those are the figures the politicians like to see, not some high-faluting thing like "a reserve of radio operators for in time of war" or "public service" or "emergency communications". Those things are the Politically Correct (PC) way of talking, just like "save the Whales, or SAve the Spotted Owl" makes great headlines and raises cash.

But once in their back offices beyond the hearing of C-SPAN, the words you'll hear are more likely to be: "What did that crazy hobby do for Ten-Tec here in the state? Oh! You mean the ham radio population is stagnant, and Ten-Tec cut their work force by 20% due to lack of sales? Gee, we better find a better use for all that spectrum. Sell it off to begin with....at auction. Then go ahead and let Ten-Tec get a nice contract to make LEO transceivers, and Jim, see to it that Ten-Tec gets a nice insider line on this contract...."

No offense meant to Ten-Tec, I just picked any american manufacturer name at random. But you get the idea. Congress likes to know things like money, jobs, and industrial growth. And everybody wants to see the Dow Jones get to 6,000 !!

Frank, radio waves are great for radios, but what about people?

All communications is ultimately person to person regardless of
any intermediary equipment that may be used. Equipment which
makes the communication more efficient, fluent, and/or transparent
benefits the people trying to communicate.

> I would still like to write the message down.

Well, handwriting does get limited to 25-30 wpm, specially if long
text is copied, your hands turn to stiff clubs!

Shorthand is no good. It is harder to learn than the code; and
many things said in radio bands have no shorthand notation.
Things like call signs, signal reports, RST, QTH, 73 etc etc need
to be spelled out, so shorthand will only save you maybe 5 - 10% of
the writing. Clearly not worth the effort.

On the other hand, you can type the copied code pretty fast. Ted
McElroy, the all time cw code champ could copy code and type it
out in excess of 80 wpm.

If you do not know how to type, it will take you maybe six months
of one hour a day schooling to get up to decent speed, like 60
Wpm and up. It is a worthwhile learning skill.

On a computer keyboard, with a word processor that wraps lines, it
is duck soup to type it out. I like to use all capital letters
as then you don't have to keep track of the shift. You might need
to reprogram a key or two so it prints out correctly instead of the
other shift state character.

The military taught us guys to copy code and type it out in these
olive-drab Underwood or Royal manual typewriters. They were horrible.
But they made good copy and a lot faster than hand writing and not
so tiring.

Be advised that even if you are a good typist, there is a degree of
mental coordination needed to copy code and type at the same time.
You will find that you can listen to the code, but not type it, or
you can type and lose track of the QSO! Kinda like rubbing your
stomach and patting your head. This is because the BRAIN part
that does the code seems to be the same part that does the typing,
(at least for us 35 wpm guys!) and until your brain finds different
neurons and trains them to handle both jobs at the same time, you
will find that 5 wpm will try your skills at both code and typing.
However, keep at it and in a few weeks your speed will shoot right
back up again.

If you do this only ocassionaly, lioke copying weather reports on c.w. and things like that, or ARRL bulletins, it is much easier to copy them to a casette recorder and then play it back at half speed. You need a 2-speed tape deck for this, and they are commonly sold for taping telephone conversations. Some microcasette recorders also have 2 speeds, and many have variable speed. Secretaries use it to record conversations, and then slow it down to transcribe on paper. The voice gets lower pitched, but not hard to follow. Ditto for CW sound.

> information will be appreciated.

Well, the cheapest is to do this. Put up a dual-band radio
transceiver, like the Alinco DR-605 on a hill top. Have it
listen on UHF, like 440 mHz and transmit on VHF, like 145.5 mHz.
This is a repeater, but it is very cheap as the radio is about
$550 dollars and no external duplexers are needed.

Then, all mobiles, portables, and base stations within range of
the repeater station transmit on UHF 440 mHz and listen on 145.5.
For this you again need dual band equipment. The person at the
repeater site can also communicate with all other stations, and
all other stations can talk among each other and talk to the
repeater station. 50 Km diameter circle, ie, all stations are
no more than 50 km away from the farthest station, is easy coverage
for this sort of equipment.

The VHF/UHF radios are about $450.00 dollars, and the antennas
are real cheap, only one antenna is needed at the repeater site.
Antennas are in the $25 to $75 dollar range.

As long as the repeater is on a high hill, even if not quite in the
middle of the area, it should work okay. However, some cautions;
do not assume that coverage is guaranteed between any two spots. The
high hills will create areas of radio shadows. It may mean a weak
signal, no signal, or a signal only with a high antenna. However,
I would guess that with the proper siting of the repeater, you would
easily cover 95% of the area.

It is important that you check coverage before you commit yourself to
making the repeater a permanent installation. For instance, get a
truck or an automobile and put a collapsible mast on it of sorts,
and try the repeater at several locations. Sometimes moving a few
meters make the difference between two awkward spots.

Next, do not be tempted by high power. On vHf/UHF, 30 to 50 watts
is plenty. Of much greater importance is antenna height. Even on a
hilltop, putting the repeater antenna high -- at least above the tree
tops -- will make a far greater difference in signal strenght.

Using HF equipment will not work reliably. You will find that some days you can talk to a station 500 km away, or even 5000 km away, but not 30 km away. Other days there will be no signal at all. And other days it will all be fine. The reason is that HF signals do not travel well over the ground, as the ground absorbs them. What the signals do is go straight up into the air, and bounce back from the Ionosphere. At night, particularly, talking 30 or 40 km might be a problem

Lastly, if you are setting this equipment up for radio hams, it is all well and good. If you are using it for non-amateur purposes on the amateur bands, you should check with the Indian government about such use, where you will probably be told that it is not allowed.

However, in many parts of the world, the amateur radio bands are smaller than the U.S. bands, and the american/japanese radios will work fine on spots next to the Indian ham bands. Such use is probably okay with the Indian authorities, but check with someone qualified to answer that question with regards to which channels are permitted and what equipment restrictions there are. Here in the United States, amateur equipment can be made by anybody. For commercial/safety bands, or mission use, etc. the equipment must be made to commercial standards and tested in a government approved lab. Many governments in countries with less radio use are much more lenient in this regards. However, if you do need commercial equipment after all, you will find the prices for the radios to be double to triple what I quoted you, and the repeater would be in the $3,000 range. And most likely, you will not use a UHF to VHF repeater but one within the same band (VHF in - VHF out) or (UHF in, UHF out). This is much more expensive even for hams.

If you have to go the commercial route, I would suggest UHF equipment as it seems to less prone to interference, has comparable range, the antennas are much smaller and can be put up higher much more easily, and the repeater stations are substantially cheaper for UHF because the duplexer is much simpler.

Good luck to you, Sir, and feel free to contact us for advice about ham radio any time. If you are not a radio ham, or your friends and associates are not either, we invite you to join our ranks and become part of a very friendly society. Although, judging from internet postings, we DO shout at each other sometimes!

Tony:

Ten years from now at renewal, if a fee is still required--but if it is not paid as required, the FCC will probably give that licensee 30-90 days to pay up. Then, if no fee shows up, the FCC would probably reassign a sequentially-issued call sign from the, then current, call sign block for the persons license class.

CW is a primary mode of communications for many hams and is intended to be
a back-up mode for all HF hams. Example:
Your having a QSO with another ham. And suddenly QRM!!! Another station is
interfering with the guy your talking with. Could have just been a change in
propagation or a lid, doesn't matter. You check up 10Khz and find a
frequency not in use. Reach for the key after you hear other guy turn it to
you and send: "Kf1xyz kf1xyz de kf4xyz QRM QRM PLS QSY up 10 ...." (this is
one reason CW is allowed anywhere in the ham bands)
Well the QRM has left just long enough for you to hear the other guy say
"kf4xyz this is kf1xyz there is a lot of QRM and someone sending code too."
So much for that QSO. He did not even recognize his own call sign. Good
thing it was not
an emergency.

I took my exam last year, may 1995. It was a friday. I called and got my
call-letters on the next wednsday. The following (A little over one
week) monday, I got my license in the mail. Hope this helps.

With all due respect, I really don't need to be exposed to more digital modes. I've worked with digital electronics since I was a teenager. I'm not a pro by any means, but I've built computers and communication systems (s/w protocols included). I see nothing different between digital comms and other forms of modulation.

Not to say that their work is worthless, on the contrary it is interesting and important.

However, personally, digital modes are ok for digital machines. Analog to digital conversions thru sampling and other techniques have been around for some time. My only insertion to this whole debate is quite simple. Anyone can build a simple CW xmtr, can anyone build an analog/digital converter?

Just food for thought.

QST all NE Amateur Radio Clubs

The Council of Eastern Massachusetts Amateur Radio Clubs (CEMARC) will be holding a meeting at the ARRL NE Division Convention in Boxboro. The meeting is on Sunday 10/6 from 9:00 - 11:00 AM. All NE clubs are invited to send a representative. This will be an informal forum for sharing ideas and information relative to club activities. All convention attendees are welcome. We will also be hosting a special event - the two candidates for ARRL NE Division Director will participate in a 30 minute Q&A panel. We look forward to seeing you in Boxboro.

Please help disseminate this information by any and all means. Also, please note the printed mailing had a typo indicating the meeting was only from 10:00 - 11:00 rather than 9:00 - 11:00 AM.

> Towers under 200 feet require no lights or markings.

Not so. The FAA is the one that governs this. The process is that the FAA reviews the tower, and they issue a notice of HAZARD or NO HAZARD to air navigation. The FCC will follow the FAA advice, and will not give permission otherwise. In rare cases a broadcast station might make a point that their tower will be in the public interest and airplanes have to avoid them, but for hams, no way.

I have done this with commercial towers about three times, and my ham tower (102 footer self supporting) once. I am now at a new QTH in the same town, so have to do the paperwork again. It is not hard at all.

Here is what the rule says, in plain english. If you are within 10,000 feet of the nearest point of the nearest airport, or helicopter pad, your tower may not exceed 20 feet above ground, or tree or man made structure other than another radio antenna. Thus you cannot build a 20 ft GMRS antenna, stack a 20 foot commercial repeater, and a 20 ft ham antenna. This won't work.

If you are within the airport itself, then there are special rules, not all spelled out by the FAA but spelled out in the operating manual and rules approved for that airport.... which usually means the municipality or the State. Otherwise, the 20 ft rule applies (and airports without approved plans and manuals are usually light aircraft type airports).

Now, say you are beyond the 10,000 ft point. In that case, you can go to 200 feet (or is it 180), and is not considered a matter that needs studying by the FAA, and the FCC does not consider it a "major action".

If you are within 10,000 feet, the tip of the antenna must not penetrate an imaginary slope of 100:1 from that airport. In that case, ground elevation comes into play, which it does not for the over 10,000 ft case.

The exception again is the 20 ft rule. You can be 10 ft from the airport and are allowed to go 20 ft above your house chimney to the tip of the antenna.

As an example, the official airport elevation is 1200 feet above sea level. Your house is exactly 5000 ft away but on a hill that is 1300 feet high, or 100 ft higher than the airport. OK, take the 5000 ft and divide by 100, you get 50 feet. Your antenna tip may be at the 1250 ft level, or comply with the 20 foot rule. Since your tower base is already at 1300 feet, you cannot put it up without FAA study, unless you stay under the 20 ft rule.

This is not the end of it. The FAA actually uses the 100:1 slope as a margin of safety. The criteria for allowing the tower are actually much more lenient, and the chances are good even your 100 ft tower on the hill would be okay. However the 10,000 ft radius and 100:1 slope is the demarcation for what needs FAA study and what does not.

The criteria goes like this, but I am not going into details. Each runway has an imaginary extended runway center line out to the 10,000 ft from the runway end. There is an imaginary trapezoidal wedge which is about 500 ft wide at the end of the runway, and it fans out to maybe 2000 ft (forget) or maybe more at the 10,000 ft point. This wedge slopes up at a slope of 50:1 for air carrier airports (read jets). The wedge is smaller in size and has a steeper slope for medium airports, and small airports. This depends on the length of the longest runway, not just the one that is pointing at your QTH.

There is also a "horizontal clearance area" which is like a round lid centered on the airport, 150 ft above the runway elevation and I forget the radius, but maybe a mile or two, but not over 10000 feet.

The slopes for smaller airports and heliports are generally 40:1 and 20:1.

There is one more slope, but it is so steep that probably goes above the 150 ft lid. That is a 7:1 slope fanning out broadside from the runway (actually the landing area which is somewhat wider than the runway itsef. It is as wide as the 500 ft or similar for the start of the runway end wedge. Narrower for little airports.

Not all is lost if your antenna penetrates any of these slopes. The FAA will also consider whether your antenna presents a hazard to existing airport operations. For instance, if the runway slope you are penetrating is landing jumbo jets on instruments, ahd has the fancy instrument landing system, etc, expect no leniency. If the runway is used for circling, vs straight in approaches, then the FAA will decide, at a committee, on what action to take. If the airport is used for strictly good weather visual flights, particularly for smaller planes, they generally will be much more generous.

However, the key to the thing is this. If the antenna pokes into any of these slopes, a notice is given to the public which has 30 days to respond. This notice might take a month or two before it gets circulated, so the process will take at least 3 months. I get these circulars all the time as I am on the mailing list. I am a 14,000 hour retired bush pilot.

Anyway, say Joe Blow at Joe's flying service gets a hair up his arse, and thinks the tower is going to impact his crop dusting or his student training flights, he will submit comments to the FAA. Usually people that do not object will not reply to the circular. But there is a line that you can sign and signify no objection.

Once the FAA gets all of these "valid aeronautical objections" back from the public (they also post in bulletin boards), then they consider your application and the objections. Right now I will say that unless the tower is egregious, they are inclined to grant the tower. However, depending on the alignment of the planets and the phase of the moon, and the mood of the FAA office personnel, or even if the wife shouted at him that morning and the car had flat tire, they might say no.

The yes or no usually takes this form. The thing will be titled Determination of No Hazard to Air Navigation, or the dreaded Determination of Hazard to Air Navigation. This will also be sent to the FCC so they can match the FAA ok or objection to your application. In the case of Amateurs, where you do not apply to the FCC for most towers, the copy you get is your permission to proceed or denial. Howefer, the FCC has the copy on file and if was a Hazard no no, and the inspector comes around, then they will get you in Civil Court for all you got. And their lawyers are very good, have public opinion on their side and win 99.99 % of such cases.

Typically you will get responses like this in the Determination of Hazard.

"The tower exceeds the horizontal zone by 30 feet" that is, your tower poked up 30 feet above the 150 foot height. This can happen with a short tower if you are on a hill.

Often the FAA will say right on the form that you may reduce the tower by 30 feet and proceed. Or they might contact you by letter, and if you agree to cut your tower 30 feet, they will just grant you the Determination of No Hazard and will not pass out any more circulars.

If your tower exeeds the slopes, not all is lost. Often there are hills, terrain, or other man made objects that govern what airplanes do in that area. However, any penetration of the slopes generally means you must mark and light your tower, but you are allowed to build it. Also, and particularly for smaller airports, if you at right angles to the runway, and not to close, they will let you go above that 150 foot lid....but with lights.

Try to avoid lighting your tower. They DO inspect these things regularly, and if your bulbs burn out you are in trouble. But not as bad as if you stuck the tower up without permission!

The people that inspect is the FAA. The airways inspectors and sometimes the safety inspectors (the same guys that checked out the value jet thing), will just travel around the area by car and just check to see your lights are all operating. Most obstruction lights are doubled up in case a bulb burns out.

The lights must operate from sunrise to sunset with a manual switch, or with a timer that corrects for seasons, or with a timer set so the lights come on before sunrise/sunset regardless of season, or they could be photocell controlled and the specification is the amount of light with the photocell pointing "at the northern sky".

One final caveat, because we see this all the time. If you abandon your tower, or sell the house but leave the tower up, even if the guy that buys the house is a ham or a commercial radio licensee, the responsibility for this tower, its paint, height and lights continue to be yours. There is a procedure for transferring the paperwork, but I have never seen it. Big fines are handed out for this.

A lot of people think the FCC inspectors don't ever come around, and they don't enforce FCC regs. That is probably close to the truth, but this is the FAA not the FCC. The FAA will handle the matter, although the FCC will send you a letter stating that the matter has been refereed to the FAA for action. Then you deal with FAA inspectors and lawyers and their in-house administrative law judges. Appeals are possible, but expect to pay $10,000 up in fees. And if you lose on appeal they will usually fine you the max.

All airports with any commercial activity whatsoever, even just a little tiny piper cub doing flight instruction on Sundays, or Joe the crop duster, get at LEAST one monthly inspection. Which one of these will also check your tower I don't know, but they surely will if Joe the cropduster complains about your tower in any way.

The larger the airport, the more often the feds come around (teams of two or more always). Big airports get daily visits monday thru friday, and many airports have permanent FAA inspectors staioned on them. Their attitude used to be good until a few years ago when the FAA got hard nosed and populated the inspector ranks with real jerks.

The value jet crash made the Congress dictate that in the future the dual charter of the FAA -- to enhance and promote aviation and safety -- has now been amended to be simply -- to enhance and promote safety. No longer do they promote aviation.

This has very profound implications. Basically the FAA inspectors, even the hard nosed ones, were people you could reason with, explain circumstances to them, etc and if you made your case, they would

dismiss the matter and would not go beyond their office. For example, you could tell the guy: Gee, the bulbs burn out last week on a power surge, and the new bulbs are on order and haven't arrived yet. Here is my checkbook to prove it. Okay, they would have probably dropped it right there, but admonish you that in the future you MUST notify the FAA local office about your lights being OTS so they NOTAM the pilots about the fact. This they do in circulars and on regular radio announcements. If the tower is a real hazard without lights, they may have told every plane specificlly on the radio. Or they could order you string some lights up there right now.

However, this attitude slowly changed starting about 1975-78, and the FAA most of the time must furnish the report to the regional counsel, with a recommendation to take no action. This is internal FAA policy and we can never know exactly what the policy is at a given time. Be advised we are not dealing with Washington FAA here, but the FAA regional offices which are little enclaves of power. For example, the permission for Boeing to build, fly and sell the 747 jet is not issued in Washington or even reviewed in Washington. It is handled by the Northwest Regional FAA office in Seattle. So these guys are basically omnipotent in many matters. Washington only gets about the second or third level of appeals.

The value jet thing has changed a lot of this. Now the FAA inspectors are JUST COPS. The mandate from Washington is for the regionals to enhance safety. This is Washington/Political euphemism for "bust the guys". Specifically, the Value Jet did not address towers, but the ruling will affect all FAA policies, including towers, and will eventually determine the type of person that gets hired for inspectors and airways personne. Translation: things will get tougher real_soon_now.

Before I close, I will also observe that there are more airports than meets the eye. Quite often we think of the 500 or so served by airliners, or the 200 or so served by airline jets. Or the county airport with a couple charter outfits and a flight school. Well, airports come in all sort of sizes, shapes and many are not obvious unless you go right to it.

Crop dusters often take a farm road, and designate it an airport. They send in a piece of paper to the FAA, and presto, instant Airport (not quite, there is the circulars and notification period), but since Joe the Radio Ham is not on the mailing list, and he probably does not frequent airport bulletin boards etc., the chances are he will never know. So DON'T ASSUME FOR ONE MINUTE YOU KNOW ALL THE AIRPORTS IN THE AREA EVEN IF YOU ARE A PILOT111

Oh, and the aeronautical maps or the airman's guide/flight supplement or airport guide will have it, right. Not so. Privately owned airports not open to the public are not shown on the maps. They used to be, but the FAA, in their infinite wisdom decided that since joe public couldn't land, they would not list them.

You will likely miss heliports on top of hospitals, (but the 20:1 slope for these are not too onerous). Farming areas often have airplanes based there.

Now, the FAA will only protect airports from radio towers if they are official airports, that is, an airport for which the paperwork has been submitted to the FAA. If you are a farmer, and have a Cessna 172 to check on your cattle or dust your crops, and you do not file the paperwork with the FAA, might find some day a broadcast staion sprang up overnight half a mile away with one those awful 1,200 foot towers and maze of guy wires .... and strobe liights that go clickety-clack day and night!

So it works both ways.

By the way, once your tower is legally up, a new airport or a new use for the airport will never take it down. But if your tower falls down, and you do not promptly rebuild, you might lose your Determination of No Hazard.

Also, some structures are beyond the control of the FAA/FCC. Tall buildings, church steeples, flagpoles, big signs, and maybe even tethered balloons,although I think the FAA closed the balloon loophole. Here is how it works in case noisy airplanes got you ticked off and you want to fix the airport but good by putting up, not a radio tower but a Church Steeple or an obelisk a quarter mile from the runway end (the Tokyo airport was shut down like this with a 70 story building about 600 feet past the end of the runway, the government had to buy all the land for two miles and pay primo dollars for it. I am not aware of anything like this happening in the USA. But here it goes.

You will often find that the City, Muncipality or County or even the State might have a mandatory Building Code. Somewhere in there, in fine print, it will say that all structures must conform to notification, approval and light/marking as per FAA/FCC regs. Some towns do not have mandatory codes, but are optional, like here in Nome. So I guess I could build my obelisk here..... but the City does require a building permit, and they approve it as they see fit, and the City fathers are very much aviation minded around here, so they might just say "get the FAA approval before we grant this."

So don't worry, they will get you coming and going. And if not, there is the insurance companies. Here is how it works. You see a little airport a quarter mile away. You decide to put an obelisk there so Joe the crop duster does not wake you up at dawn with a roaring engine. You check the building codes, not mandatory in the State or County. You are outside city limits. No building permit required. Aha! I got the sob's.

So you put the obelisk up, and Joe the cropduster runs into it at dawn the next day. Doesn't even dent your obelisk. Well,

the authorities and the insurance companies will not see it that way. Read your policy, you will probably find exclusions for "deviation from the STANDARDS for aviation safety." In other words, they want you to build your obelisk as if it was a radio tower. In court they will not defend you nor pay the benefits. And be assured that the estate of Joe the Crop Duster will sue you for all you got with a most excellent chance of winning. Grounds are: deliberate construction of a hazardous structure and a peril to air navigation". Etc etc. And if they even get wind you did it just to stop Joe, they could not only sue you, but also maybe get your for murder one. However, you could probably build your obelisk if you inform the airport, etc. Also however, if you notify the FAA it means to them that you are voluntarily requesting the Determination of Hazard/No Hazard (like for buildings and non regulated structures), and they most assuredly will issue the Hazard one. In which case if you go ahead and put it up anyway, they can't make you take it down (unless the City or some other local law cna be made to apply), but when a structure is put up without regard to the Determination of Hazard to Air Navigation, the courts, the insureance companies and probably even God, will take the stand that you are responsible and liable for all consequences. Even telling Joe the Crop duster might not work. Some day a student pilot from Podunk, Arkasas 100 miles away will decide to land there and bump your obelisk and there you are. Penniless. And maybe even defending yourself with far less chance than O.J. had for his double murder charge. [I am white, but my opinion is that the police sprinkled blood on the scene like a catholic priest sprinkles holy water. We'll never know if OJ did it, the police ruined its own case. And the glove didn't fit. The guy may end up penniless too, unless his dough is in Switzerland or the Cayman islands or put in trust for the kids.]

Lets see what sort of flames that last statment gets from the fringe element on the ham newsgroup!!

73, and good luck to you

PS: check with the FAA office for the latest regs and numbers, I am about 10 years out of date on all of this stuff. It will be more or less the same, but who knows what the exact numbers are?

Ramon, AL7X, Nome, Alaska [all I got right now is a 2 meter whip on the roof. Want to put my tower up this
next summer? I am well within the distance
to two airports and a heliport. Want to see the paperwork?]

Nobody is forcing you or anybody else to use digital modes, if one wishes to use Morse code for communications, that is their perogative. However, if you see that there is no difference between analogue and digital communications, what is your point?

>and the like, or the set sends carrier with no modulation.

Well, I'm not sure what isn't correct. I said "if you don't have
some kind of emergency transmitter to start with, you're not going
to have a transmitter", and then you correct me with a couple of
examples of how an emergency transmitter can be repaired.

The 'broken mike cable' is a red herring; if mike cables are that
liable to break, why not pack a spare microphone, perhaps along with
the code key? I'm not being unreasonable - I'm just pointing out
the value of valid preparation for an emergency. Note that an SSB
transmitter does not send a carrier with no modulation, but a VHF
marine radio does.

>If I was a radio officer on a ship, and out of port on the high
>seas I burnt out an irreplaceable component on a voice transmitter,

>CW. In fact, this happens often.

A day or two? Goodness, this isn't much of an emergency, is it? ;-)
How often does it *really* happen that an SSB transmitter blows up
the way you describe?

>Now, should the boat be sinking, there is a chance to send a CW SOS.

I suppose if the boat is kind enough to wait to sink until after the
failed radio has been hacked into a CW transmitter this helps. Wouldn't
it just be easier to pack a spare radio for situations like this?
No hacking, just switch the radios and continue operating. Maybe the
expense of the spare radio is a concern...

Sure sounds like GMDSS is an improvement over the human code operator.

>By the way, I am all in favor of NO-CODE testing. It is just that

I like CW too, but I believe the claims of superiority for CW are just
too contrived to be valid.

I am glad that you are so prepared because every time you slander me on the net I am going to complain to your ISP. If you choose to slander me from your place of employment that is your problem. Perhaps we can learn empirically all about your claimed Carte Blance internet account. You see Chris the only recourse I have is to complain to your ISP and ask to have the slander stopped.

Since you are so confident would you like to give me the email address of the University Council or shall I research that myself? No matter they will be on distribution. The smart thing would be to get a personal account but I never accused you of being smart.

Perhaps defied would have been a better word than invited. What do you expect me to do? I refuse to let you can me a liar in public and you hide behind the skirts of your employer calling names. Well it won't wash any more. You call me a liar and I will go directly to your ISP who ever that might be.

Hi ....

Well Im sitting here looking at some old AB pots and was wondering if they are
any good for audio work... or anything... they seem to be pretty well made.
they are sealed with something (are they carbon tracking? btw) and what does
"TYPE J" mean ?? is that lin or log ?

if you can give me the low down
thanks if you know..

>error rate. That 48 dB sounds like an 8 bit ADC.

Oh, I see what you're doing. The A/D doesn't respond directly to
signal power. It responds to signal current. So the proper ratio
is 20*log(2^16)=96.33 db. That's the maximum possible ratio of
signal power above the quantization noise. But I can't use that
range properly. The signal is buried in real noise (channel noise)
and mixed with real signals, both above the quantization threshold,
and it has a finite span of its own. I need that span to be more than
one bit to do any meaningful processing of it, IE so I can extract
it from the channel crud and demodulate it.

I might be able to get away with 2 bits if the signal waveform
were a simple square wave, but to recover the more complex waveform
of QPSK, I need more bits. 4 may do, but 8 works lots better.
So a 2 bit span reduces the usable dynamic range by 12 db, 4 bits
by 24 db, and 8 bits by 48 db.

Note, the A/D can *handle* a wider span than that, but if my
desired signal plus other passband crud gets within 4 bits of
either limit, it clips, and I can't process it properly. So
that effectively reduces my dynamic range by 8 bits, or 48 db.
Or stated another way, the sum of my signal and channel crud
has to stay 24 db below the all 1s condition and my signal
has to be 24 db above the quantization limit, IE all 0s. Of
course both limits don't occur at the same time, so perhaps

you could say I have 72 db of dynamic range with the current
setup. I don't think that's the proper way to look at it
though.

>>But as noted above, that won't remain a problem much longer.
>>And just as well that I'll be going to separate converters

>between the I/Q mixers and the ADC and with this you gets rid of the
>problem of very strong signals with an offset more than 20 kHz from
>the desired signal.

The brickwall filters do reduce signals which are more than
+/- 20 kHz from the desired signal, but that isn't a great help
at HF where signals sit cheek by jowl. I need to be able to work
closer than that to a strong signal. I want to be able to work
with signals on 1 kHz channel centers at the dynamic signal
extremes.

I'm not using really aggressive brickwall filters to avoid
introducing undesirable phase shift in the I and Q channels.
About all I'm doing is 12 db per octave, IE a simple RC. I
could get more elaborate than that as long as I could assure
equal phase shift in each channel. That starts to become a
problem pretty quickly, though, and 40 db per octave is
probably about as far as is practical to go. (I can, of
course, achieve close in filtering as tight as I want with
processing, but to do that, the signals have to stay inside
the dynamic range of the A/D.)

The codec does oversample at a 64x rate (and uses decimation
to give an effective sample rate of 44 kHz), so the brickwall
requirements for anti-aliasing aren't as severe as they might
appear at first, IE the anti-aliasing rejection is 93 db in
the current setup. But that doesn't do much close in.

24 bits with an 8 bit sample span does give me 96.5 db of
dynamic range, though, and I can live with that on HF.
In fact I really couldn't use more because aliasing
could start to be a problem.

>If we assume 300 K antenna temperature (-174
>dBm/Hz) and 20 kHz anti-alias filter bandwidth, the equivalent antenna
>noise power is -141 dBm and with 146 dB SNR, the maximum signal would
>be +5 dBm. On HF, the antenna temperature is several order of
>magnitudes more than this and thus the dynamic window can be shifted
>upwards allowing maximum signals in the order of 1 W within the 20 kHz

>passband. In my opinion, it is not realistic to design ham gear for
>such a specification. A 16 to 20 bit system would in most cases be
>sufficient, with a great reduction in cost.

I think you're overlooking the need to have enough signal span to
do processing. The figures you're using for the A/D are only for the
maximum span above the quantization limit. When you allow the signals
to have a finite amplitude span which must be reproduced, the effective
range becomes much less.

It may be that I don't understand the problem correctly, but my
lashup seems to confirm what I'm saying above.

Gary

>

Right on. The Class B (later general) gave you phone on 160 and
10 meters. There was no 15 meters before 1951 or 53, and 40
meters was all c.w. only. With the Class A you could use 75
meter and 20 meter phone. As I recall you had to have been
a Class B for a year or two, but the Class A test was not much
harder than the B. Code was the same 13 wpm.

There were no other licenses. Just A and B. No novice or anything
like that. When did the Novice start? 1953 I believe.

But there was an Extra Class license issued during the 1920's by
the Federal RAdio Commission. I do not know if the FCC kept this
license class when the FCC came into being in 1934. It could be
renewed, but after world war two very few were left to renew.

When incentive licensing came about in '68, they made the mess
that there is now. Former Class A's and Advanced Class
hams were grandfathered to Advanced, Class B's and generals
were grandfathered to general. Conditional (Generals with the
test by mail for people living far from FCC offices) were also
issued Generals. At one time the FCC rule was that a Conditional,
upon moving closer than the distance limit, would have to be
retested at the FCC office, which is why it was called conditional.
But later on they quit doing this as it was not practical to
retest all these hams.

Anyway, the Extra class was reinstated. Old Extras were grandfathered
in; the test and license in fact was restored in the early 60's
before incentive licensing as a prestige sort of things, with
privileges promised, but never actually granted.

Also, people holding a license before 1917 were also given
credit for parts of the test (like the morse code), and maybe

even grandfathered in. So a lot of real old timers that had dropped their license and couldn't pass the test for squat got into ham radio that way. Extra Class, to boot.

Somewhere in the 50's, the privileges for the advanced license were done away with, the license could be renewed but was no longer available for issuance, and Conditionals and Generals got to operate with full privileges. This held until incentive licensing in 1968.

Here was the lineup in 1959 when I got my ticket.

Novice. 5 WPM, dead simple written, much easier than todays Novice written. The written was simply a no-brainer. No theory or technical questions, except maybe for some dumb ones like "What does an Antenna Do" (1) radiate your signal and intercepts others (2) Creates TVI (3) Nothing (4) tangles your lawnmower when it falls down.

Privileges: 75 watts, crystal control only, 3700-3750 in the early 50's, later amplified first to 7150-7200 and then 21100 to 21250. All CW only. For a time, off and on, 2-meter privileges were granted, taken away, granted again, etc. Remember, in those days there was no FM, no repeaters and the typical 2-m rig was home made, or a Surplus aircraft SCR-522 (I had one!), or a Gonset II Communicator or a Heathkit Twoer lunch box. All of these put out a not-too-stable signal on two meters, AM, with maybe 5 watts tops. The heath had maybe one watt out. 2 meters was not popular until in the 60's the FCC changed the commercial 2-way radio regulations and overnight all lthe 15-kHz deviation radios became obsolete. Hams picked good quality RCA, Aerotron, Motorola, GE, Link.... (I had a Link!) for next to nothing...often by the pound, and instantly 2 meters went FM and never stopped.

Novice license was good for one year and was not renewable. Only issued once in your lifetime. Upgrade within a year, or go off the air. In thosed days, going from nothing to General was quite normal. 13 WPM? That was fun!

Technician. This license came about to allow experimenters on VHF. My memory fails me, but I think for a short while the 2-meter tech band was 145-147 like the Novices, but I might be wrong. IN any case, except for my 2-meter lapse in memory, it was "full privileges above 50 mHz. This license was the General written but 5 WPM.

Now, the Novice and Tech were examined by the FCC field office for years, but they phased it out in favor of test by mail. ONly one examiner, and he had to be General or higher, Conditionals not allowed to give the test.

If you took the Novice or Technician license at the real FCC office (mine was by mail), there was some sort of note in the FCC records to that effect, maybe just the issue date, and you would get credit for 5 WPM or the Written test, as the case may be. If you had an FCC issued novice, you could just take the written and be Technician, even if the tech test was by mail. This alwo worked going tech to General, you could claim credit for the written.

However, you could not use a mail order Novice license to claim 5 WPM credit on your mail order technician, however, you could take both tests at the same time and get both licenses simultaneously, which is what I did. The Novice and technician ticket combination was common.

In those days, 6-meters was the popular technician band, all AM phone, with a smattering of CW. The vast majority of these guys got on 6-meters, never worked the code, and had their novice portion expire (remember, not renewable?), so they stayed technician after that. Look in the callbook and you will see a lot of old time calls, like W2FCJ and such, and he is a tech.

Gotta practice to get the 13 wpm! I never touched 6 meters because I knew this was a venus trap to keep me from my general!

Conditional and General shared the exact same test. Except the Conditional was mail order test, the General at the FCC office. This situation existed long before the Novice and Technician licenses, even in the 1930's and was called Class C. It had the same privileges as General. No phone on 75 and 20, else full privileges.

BAnds were a bit different then. Prewar bands were 160, 80, 40, 20 and 10 meters. VHF was 5 meters (56-60) and 2.5 meters, 112 to 116. There was a 400-401 mHz band. The 160 meter band was 1715 kHz to 2000 kHz (kc/s in those days), and in several countries, like Russia, still is. It was a very popular band before the World War II. During the war, the super-secret Loran-A took over the band and amateurs were basically excluded until the mid 1960's. Basically, anyone on the coast had a 200 watt day, 100 watt night, or maybe even 100 day, 50 or 25 watt night limit. And the frequencies were specified in very narrow bands of 25 kc/s or 50 kc/s, forget which. So for instance, in California you might get 100 watts day, 25 watts night in the segment 1800 kc/s to 1825 kc/s. Buyt the hams in oregon might have 200 day, 50 night on 1975-2000. So you called CQ in your little band and tuned the whole band for replies. Long CQ's and long calls were the norm! So 160 after the war became less than popular.

80 and 40 were the same as today, but phone was more limited. 75 phone, in my day, was 3800 to 4000, but I think somewhat narrower before then, maybe 3900 and up. There was no 40 meter phone. It was all CW. In the 50's they opened up 7200-7300 for phone, and you had all sorts of fun evading Radio Moscow, Radio Peking and the Voice of America relay transmitters outside the american continent. Radio Moscow, on 7250 was reputed to have 2 megawatts and maybe 50 element collinear beam aimed right at the USA. Other than a local ham less than amile away, this was the one that would peg yuour S-meter!

20 meters before the war was 14000-14400. There is talk of recouping this 50 kHz real_soon_now. The top 50 kc/s went for the Fixed Service, mostly Russian in 1946. In addition, all soviet countries reserved 14250-14,350 kc/s for non ham use.

There was no 15 meters before 1951 or 1953. It has always been 21000-21450, and in the days until the 70's was voice on 21,250 and up.

Ten Meters was 28-30 before the war, then 28-29.7 after the war. This was a very popular band, specially after the Sunspot high in 1947 and 1958. I got my General ticket in early 1960, ten meters was hot as a pistol, and I rewound my transmitter coils to double on the final from my 807 novice rig (home made). This poor tube, as a doubler, was very inefficient and got cherry red hot in the plate, and put only 10 watts or so to the antenna. No PI network, it was all link coupled in those days.

I had the ham shack on the second floor of the house, so little 13 year old Ramon nailed 4 little nails in the form of a square to the wall. High up near the eave of the house. I wrapped wire around this in a square loop to make a one element quad element that fired norht to south. I used the new fangled coax cable, RG-11 75 ohm in those days, and my newest toy, the Heathkit SWR bridge, where I confirmed my rig was putting out, and the SWR was under 3:1. 3 to 1 was the needle straight up on the reflected setting, and the dial had a red band above that, so that was the figure to shoot for. My quad element gave me about a 1.5 swr in 28,650 where I had a crystal for.

I built a modulator with push pull 6AQ5 tubes, which were miniature tubes, but powerful. Got maybe 10-15 watts of audio out of it. A hi-fi amplifier or preamp drove it. All this was basically built the day I got the General Ticket, which took 3 - 4 months to get from the FCC. Might have taken one day for the antenna and the r.f deck, and one day to cobble the modulator, etc. The local

BC station donated some kinda microphone, and I was on
10 phone. By the end of the first day of operation I had
worked all continents, including Antarctica and Australia.
Hell of a band!

Advanced and Extra Class. These had no additional privileges until
1968 as mentioned before. The FCC rules said Generals
Conditionals and Advanceds had full privileges. Extra
Class had "full privileges" "plus any extra privileges the
commission may grant", but they never did grant any. Oh,
the FCC would, upon request, issue you a nice Certificate,
suitable for framing with the extra class license. Mine
is dated 1962, signed by the Engineer In Charge, Edwin
Klein, (KP4UW,now deceased of old age and Whisky, damn
his eyes!). This radio inspector was the terror of all
hams and we were all familiar with the little fat bastard
in the black chevvy, black rimmed tires, and US government
plates. He would come around, briefcase in hand, knock once
and barge right in. In those days, the FCC could inspect
your station, at any time, upon demand, without warrant.
Much later they added "at reasonable hours" to the reg.
Indeed, the guy liked to come around when you were on the
air, regardless of hour of day or night, or early in
the morning when you was doing your ablutions prior to
going to school. Oh, and he handed out violations left
and right, but I was th= smartest novice and he never
nailed me! Although twice I got the dreaded letter that
said "explain to the satisfaction of the Commission, within
10 days...". But in both cases it was TVI and I proved I
was not at fault. The guy must have come around about
10 - 12 times and other local hams reported similarly.
In 1959-60 he was gung-ho, but by 1967 he was too fat
and spent his time chewing his pipe and listening in on
his dual Collins 51J4 receivers at the FCC field office.

TESTS. In those days the tests were answered in long hand, they
were not multiple choice. The FCC moved to multiple
choice with the Novice ticket and slowly expanded the
program to include all classes. My own case, the technician
test was multiple choice, in 1958, I was 13. But my
General in 1960 was long hand with hand drawn schematics
for complete rigs, or parts of rigs.

"Draw the schematic diagram for a triode push pull r.f.
amplifier, show neutralization" ..... or "draw the
diagram for a one-tube oscillator-converter stage on
a superhet receiver" "draw the schematic for a vhf
superregenerative detector and show typical circuit
values for a quench frequency of 200 cycles"

In 1962 I got an offer to be a sparks on a coastal steamer, (in the end I never landed the job), so I rushed to the FCC office to take, cold turkey, the Commercial 2d telegraph and radar endorsement test. The test was also in long hand, and in those days spark transmitters were allowed for the standby radio on a ship. A Liberty Ship freighter I visited in 1961 had a tube type main set on 500 khz and few working channels just below that. The autoalarm panel was huge (it would count received dashes of several seconds duration, and when 4 or more were recieved would ring a bell in the sparks quarters. With no auto alarm, there had to be an operator on duty 24 hrs a day. Union rules dictated the hours and pay, which were very good. (Still are!), but with the auto alarm, only one operator shipped to sea on a cargo vessel.

The 500 kc/s transmitter was 5 kilowatts. In the next room over was the standby transmitters. There was a 10-inch rotary spark set on 500 kHz, and ran 15 kilowatts of power. A CW transmitter of about 100 watts would push it right out of the way, but the spark set would cut thru QRM as it was broad and you could tune to the side of the signal away from QRM. It was tone modulated in that it was a synchronous spark. This means that the rotary spark gaps were timed to coincide with the peaks of the AC power applied. With the right AC, rpm, and synchronicity -- all supplied by a big motor generator set running on 110 DC, or batteries as the situation dictated, the set would make a nice 700 or 800 cycle tone. The spark wheel was maybe 6 - 7 foot diameter, and when the key was pushed, it was awsome. FCC allowed this monster to be tested "as neccesary to ensure its condition, but not to be used for communications except in an emergency" That ruling went in effect 1934 when spark was outlawed. There was one further spark set, about 3-inches, just a fixed open spark, with a vibrator interrupter at about 500 cycles or so, but since it wasn't sychronous, the note would be buzzy and raw. The receivers were all tube, but by law there had to be at least ONE crystal set for the 500 kc/s frequency. Believe it or not, you could pick up all sorts of traffic on this thing. I wish to add that I said the 500 kc 5 kilowatt tube rig was CW. It was actually modulated CW. In other words, the trasmitter was AM modulated 100% by a tone. This ensured that AM sets as well as CW sets could pick up the signal. The modulator had no tubes. It used AC generated by another motor generator at 250 or 500 cycles. I think there was some arrangement that doubled the modulation tone, but not sure now. All this gear was immaculate, and perfectly maintained. The spark sets were totally bulletproof.

On the commercial test, 1962, there were all sort of questions on spark, all to be anwered longhand. All the intricacies of spark, sychrounous rotary, plain rotary, arc, quenched arc, crystal detectors, cats whiskers, coherer detectors, electrolyte detectors, hot-wire r.f. ammeters, etc. all had to be written out, diagrams drawn etc. Since this was obsolete stuff, it was not mainstream knowledge and would have taken time to study and learn, but I was a avid student of all these arcane things (at the time) I knew it well enough to pass the test first crack. Of course, there wss questions on tube gear, receivers, transmitters, etc. The radar test had all sort of questions on Klystrons, magnetrons, spark gap T/R switches, A scopes, S scopes, E scopes, antenna and display synchornization, etc. In a huge radar set I worked on later, the display was an electrostatic deflection CRT, with the deflection plates mounted EXTERNAL to the tube, which was 3 ft long or more for a 12 inch screen. The tube had a gear on the periphery, and it was rotated in synchorization with the big bed spring antenna. Connections for filaments, grids, and anode voltage were done thru slip rings. That set was totally awsome! At about 2.5 gHz, or maybe 400 mHz.

Instead I took a job at a broadcast station that needed a First Class operator (radiotelephone), and I tood that test cold turkey and passed. In fact the only FCC test I ever flunked was 7 times on the stupid General 13 WPM code test. I could copy, as a novice, 20 wpm or more, but when that fat bastard was standing over me taking the code test, I just got the jitters. My Novice expired but 2 weeks later I passed the receiving test and I was home free.

The code machine was a paper tape reader that could be set for speed. The code came in on headphones, but the machine was real noisy, clackety clack, so it was a distraction. Mr. Klein (damn his eyes) said, thats QRM for you! Always it seemed he stood behind me, although every time I went there (tests were Fridays only at 10 am, rigorous deadline), were at least a dozen people taking tests, maybe 50% taking the morse test, the rest the no-code commercial licenses, or amateur writtens, etc.

The commercial 2d class telegraph test is 20 wpm of plain text and 16 groups per minute of scrambled letters, numbers, punctuation marks and prosigns. The punctuation marks for the commercial test are a bit more than those for hams. They had exclamation marks, parentheses, dollar signs, percents and ampersands. For the life of me I can't remember a single one of them. Never used it on the ham bands, and 34 years is a long time. But at the time it was duck soup as by 1962 I could copy, on a typewriter, about 35 wpm -- and still do.

Oh! The ham code tests had to be taken with a pencil, unless you had a disability. Then you could use a typewriter. You were not allowed to dictate your answers for the commercial test, but I think you could if disabled, do the code test by voice. However, there was a sending test, and you had to send that by hand, the FCC would provice a straight key, but you could bring in any sort of manual key, like a Vibroplex or Lionel Bug. Mine was Lionel (WW-2 vintage, by the toy train maker, which made bugs during the war. It was the nicest key I ever had). The commercial test had to be taken by typewriter, but they allowe you to use longhand with pencil if you could not type or were disabled (like only one hand or arm). The trick here was that if you had one hand, or some other permanent disabilty, your commercial ticket would be endorsed "Not valid for use on board a vessel of the United States", but you could still work at a shore telegraph station. I saw an amputee do exactly this one time, and he got a fine job at WMT shore station, paying him a better salary than my dad made as a lawyer. And he was about 22 and a brand new operator. I have since lost track of him; he wasn't a ham. In fact, I saw very few radiotelegraph operators that were hams too. Maybe only 10% overlapped both licenses.

In later years, I took my Extra Class, just showed my 2d telegraph and instant code credit for the 20 wpm plain text on the commercial. This was in 1964 in Chicago, Ill to which I went as a tourist, and by happenstance saw the FCC building downtown, called from a pub, and sure enough, if you come before 10 am you can take any test today. Well, I opened my wallet and there was dog-eared Verification Card for the 2d telegraph, so I went right on up -- FCC offices are always on the top floor, shorter feedlines.

Showed the commercial ticket, and they looked up my ham call in a callbook, verified my driver's license, and gave me the written which I passed. Then I had to mail in my ham license (I did not have that one on me at the day of the test). They sent it back, or a letter acknowleging it, and in 8 weeks I was instant Extra Class ham. Jumping frijoles!

When incentive licensing came about, the biggest enemy of it was Wayne Green, W2NSD, of CQ magazine. Now he is W2NSD/1 in Peterborough, NH and writes-but no longer owns - 73 magazine. His style of writing has not changed one whit in 40 years or more of writing for ham magazines. He is so radical, so liberal, that even Ted Kennedy and his Democrats would be PROUD to make him Al Gore's running mate in 2000! Which is, of course, the last year of the 20th century as any educated person knows.

My remarks on modern ham radio? On 2 - meters FM, packet, SSB, moonbounce, satellites, SSTV (I built McDonalds scanner in 1959-60), solid state, incentive licensing, and no-code tickets????

Answer: You've come a LONG way baby!

Joke for the day: Notice how when you get three or four fishermen together, there is usually a fifth?

73,
Ramon, AL7X, Nome, Alaska. Pro NO CODE, but keep the CW subbands!

> .. Morse can be viewed as bits, just as can data, or voice (in
> digitized equivalent form, if you like) ... QSOs/Hz makes NO sense ...

Well as much as it pains me to say so, QSOs/Hz is a valid metric. It
basically measures how many concurrent QSOs can take place in
a given bandwidth. Given the variable speed at which humans generate
information, it makes sense as it measures occupancy, not throughput.
This is one reason that packet as bad as it is can provide reasonable
QSOs/Hz numbers as its wider bandwidth (compared to most OOK
Morse Code contacts) allows multiple simultaneous contacts.
A mechanism that provides high bits/sec/Hz can also exhibit high
QSOs/Hz. So both are valid measures.

>>In the end, you still
>>have to pack a number of QSOs into the available bandwidth. Incidentally,
>>the "wider is better" myth fell out of favor about two years ago.

Care to expand upon this Paul? I think Gary summed up the trade-offs
pretty well last week.

>>Oh yes you have. You've repeately called for a mandated change from
>>"outdated" technology to something new.

> No, I said "Eliminate the mandatory code test and let new technology
> flourish instead of maintaining a repressive, backward status quo."

The two are not the same. I don't believe Carl is asking for a mandated
change in technology, only an elimination of a mandated mode test.

Hello,

I am trying to run MBBIOS (and the DOS-versoin of FBB) under Win95.
MBBIOS won't start (i.e FBB can't sync the modem at startup). Is there
a way to let MBBIOS to have full access to COM2 ? Something to write
in the sysintem.ini-file perhaps....?

Or how is it done otherwise....

I am in search for a telephone Interface to connect my HTX-404
(Realistic from Radio Shack) pair of handheld tranceivers.
Should be able to work in PULSE-TONE Mode (The telephone system in use
here in Greece is in the process of changing from pulse to tone), and
in SIMPLEX Mode since the HTX-404 works ONLY in UHF
frequencies(430-450 MHZ).
Any sources (Phone, Fax), Price, suggestions,advises would be very
much appreciated. Thanking you in Advance John.

I've never done it (my speed isn't nearly 25 wpm yet), but I've read that
most high speed operators copy using a typewriter (or in this modern age
a computer and keyboard and word processing).

From: ape@atlas.spacetec.no
Message-ID: <52ujrn$27j@o.online.no>
Source record: 215596

We have bougth a PK-96 modem for testing.
Our plan is to communicate with 120 other HAM modems/radios (PK-96)
The main question is : Can we get a bit rate up to 9600 with AX25 ?
The baud rate is 1200 or 9600.
How long (worst case) will it take to transmit one packet to all the 120 radios ?

What's the best radio and modem for this job (small size !) ?

Thanks in advance for any help.

Asbjoern.

It depends on the charger, and to some extent on the battery. There are intelligent chargers that will not hurt the battery. There are dumb chargers that stuff amperes into the poor thing until it gets all dried out. Then there are tiny trickle chargers that don't do much harm, but any such charger is slow and if left on for weeks and months will eventually cook the battery.

Then, the radio manufacturers make a big markup on batteries. They may want to sell you some! Here is why. Those nice little square boxes that are the 9.6 volt battery pack for the Super 300 handie talkie looks like it is something special. Well, the plastic box is, and made by the thousands might cost $1 each, or maybe much less.

But inside, there are just standard NiCad cells. These are available in various sizes, the most common are AA size, 2/3 length AA, and 1/2 length AA. There are other sizes too. These can be had with solder tabs on them, no tabs like flashlight batteries, or weldable ends. They cost no more than regular AA batteries in single quantities and these folk buy in bulk, so a complete set of 8 cells for the 9.6 volt example above might cost the manufacturer only $2 to $5. Figure maybe $5 in assembly line labor to stuff the batteries in, solder them and glue the lid on. You have a total investment of $10 tops. Maybe much less. These batteries sell for about $50 to $80 from the radio manufacturer, or they can be rebuilt for about half that at several places, with brand new Nicads put into your little box. For popular radios, these battery oufits will often just sell you identical battery packs. Maybe they get them from the same source that made the radio for Yaesu, Kenwood Alinco, etc.

You could rebuild it yourself, but sometimes the cells are exotic, or they are electronically welded, or the plastic box is glued so tight that there is no opening it without damaging it. And since you buy cells at retail price, the cost savinss is probably not worth the aggravation.

Ramon, AL7X, Nome, Alaska.

I also am involved with the "newest" telecommunications systems and have
been
for almost 30 years until my retirement 6 months ago. While The
original statement
in this message is accurate regarding telecommunications, it (in my
opinion) has
no bearing on amateur radio. They are two separate issues. What good
are the
high speed digital "wired" connections when an earthquake takes down the
wires?
When the power is down? When the back-up generators run out of fuel?
These
events can happen and did happen during the Northridge quake in
California. I'm
six miles from the center of that one. The only method we had of
getting through
on a consistent basis was hf cw. Why? Because this area is surounded
by mountains
and vhf just was not cutting it. CW got through with reliability.

Regarding satelite transmission, experience has also shown that
following a major

quake, even the dishes had to be realigned to regain communications with the
bird. Perhaps that can be done in a few minutes -- or take hours. HF is online
and ready withing minutes. Time and time again, this has been proven. Just think
back to any major emergency. Who were the newscasters getting their information
from? Was it a telecommunications hi-speed system or were we hearing broadcasts
from ham radio stations in the disaster area?

Hi Frank, they don't have to. Intel, et.al., did it already on a single chip also containing a microcontroller and I/O electronics. It would take me longer to get a CW xmtr working than an A/D converter working. Digital is super easy compared to RF. If it ain't a '1' or a '0' it's broke. If a digital electronics test were substituted for the CW test, ham radio would smarten up overnight.

I would suggest simply kill-filing or ignoring the pro-code ignoramus
who insists on posting with th bogus pseudonym and address of "Sam
Morse" ... it's not "cute" or clever ... it's just a troll ...

It's clear that he cannot be/does not want to be reasoned with and is
totally unwilling to listen to or accept arguments that go against the
code, no matter how accurate and factual ...
so why waste the bandwidth providing gratification to someone who's not
even committed to his "cause" enough to use his real name and callsign?

Everyone is, of course, free to do what you want, but IMHO your time
here is better spent debating the issues with people who are at least
honest enough to correctly identify themselves ...

>

I think 2-3 million would be great ... and is probably achieveable with
modern licensing requirements and rules and regs that are in keeping
with today's technology and not artificially restrictive on waveforms,
coding, bandwidth, etc. This would be "a good thing."

>I see the removal of the testing requirement as a further lowering of the
>entrance requirements for ham radio. If the theory and math tests are

>fewer non-technical trades and professions in ham radio, and I don't see
>that as necessarily a good thing. Besides, why would the tests need
>stiffening, if the morse test requirement is dropped?
>

I don't think that the tests should be made SO hard that ONLY engineers
could pass ... plumbers and carpenters and others can learn the theory,
too. There would be significantly more engineers, though ... with
modern rules and a lifting of the Morse "choke hold." That would be a
good thing ... more technically competent folks to Elmer the
non-electronics professionals and help them to learn more about how
their radios work ...

>Will morse survive? I think the better question is, will ham radio
>survive.

Ham radio will not survive two decades into the 21st century if we DON'T
make these modernizing changes ...

>I hope you will enjoy it through all the QRM, when all those millions of
>new hams get their KW SSB rigs on the air. The only happy people are
>likely to be the equipment manufacturers, who will become much wealthier.
>

New technogies will actually REDUCE QRM while supporting far more
users/MHz than present ... SSB (as you know it) will gradually be
replaced with newer techniques yielding greater efficiencies.

KW amplifiers will become passe as everyone begins to use better
modulation and encoding schemes that permit more reliable communications
with less power ... and radios that automatically enforce the "use the

minimum power necessary" rule ... in time, using a KW amplifier will be frowned on in most applications as being "extremely wasteful" and impolite (much like running too much power through the satellite transponders and hogging the transponder power is viewed today)

I just recently started listening to WMRI (9.955, Miami).
The last couple of nights there is a tremendous amount of noise
almost obliterating the station. The noise started as a sound
like bubbling water. Later a sound somewhat like a radial saw
came in too. Where is all this jamming coming from and why?

There were several old articles in QST by W. Hayward on determining crystal parameters. However, he used the 3db method of determining Q which is very sensitive and prone to error, requiring measuring two freq's very accurately to determine 3db down response of each crystal. Also, the parameters he uses in the articles are not the ones generally used in professional literature for filter synthesis.

A better method is presented in the book "Crystal Filters: Design, Manufacture, and Application" by Robert Kinsman of Motorola (Wiley InterScience, 1987). On pp. 25-27 he describes the method of using a 12.5ohm pi-network to determine Q and Fs, which lends itself to fast sorting of crystals for a target Q. All one has to do is to calculate some output voltage from the pi-network for whatever crystal Q you are targeting, and then simply look on your scope or RF voltmeter and reject all the crystals below the target output voltage level.

Its superior when sorting out 100 or so uP 9.0mhz crystals when you are designing 8-16 pole ladder filters, since differences in Fs of the individual crystals will also show up as lowered ouput readings. Thus you can also simultaneously sort out the crystals that are on the outskirts of the Fs distribution for your 100pc sample.

The Kinsman book also has the easiest to understand info that I have seen on designing lattice filters and cascading 2 and 4 pole monolithic filters.

WRMI is being jammed by transmitters in Cuba, as the station has been
known to carry anti-Castro programming, mostly in Spanish.

Robert G. Strickland (rcrgs@regcon.syr.servtech.com) wrote:
: Is it okay to keep nicads in the recharger for extended periods of
: time?...

You'll probably get many responses on this, but here goes anyway. I haven't posted in a while :-).

It all depends on the charge rate. It's most likely *not* ok to leave nicads on a C/10 charge rate forever. A C/10 charge rate generally charges nicads in 14-16 hours. For example, my Yaesu wall charger delivers about 60 ma and charges my 600 maH battery in about 15 hours. After that, the battery starts heating and you'll eventually lose battery capacity.

How much can you jam in there "forever" and not hurt the battery but yet keep it fully charged? I'm not sure there's a clear answer. Probably something in the range of C/50 to C/100. Perhaps others will have some good data...

-Paul C. KG0CZ

4259. Where can I find calls for commercial license holders

Newsgroup: rec.radio.amateur.misc
Date: 1996-10-02 00:00:00 UTC
From: Joe G Wesley <jwesley@tenet.edu>
Message-ID: <52sht5$7gh@excelsior.flash.net>
Source record: 215672

I have a need to locate some calls and frequencies for commercial license holders. Is there an online database similar to the various ham call lookups like QRZ ??

If you can send me in the right direction, please email me at jwesley@tenet.edu

==========

2. FLARES AND SHORT-WAVE FADEOUTS - NONE

2.1 Comments on Solar Activity.
Solar activity was at very low levels for the entire month.

==========

3. GEOMAGNETIC DISTURBANCES (for Learmonth, WA)

DATE COMMENTS
10 Sep 96 active to minor storm periods 00-15UT
12 Sep 96 unsettled to active
16 Sep 96 quiet to active
18 Sep 96 unsettled to active
20 Sep 96 unsettled to minor storm
21 Sep 96 unsettled to active
22 Sep 96 active to minor storm
23 Sep 96 active to minor storm
26 Sep 96 unsettled to minor storm levels

Increased levels of geomagnetic activity was observed during
the month of September. Two general recurrent intervals
seem to have emerged, the first during the period 10-16
September and the second during the interval 19-28 September.
These disturbed periods are believed to be in association
with coronal holes.

Disturbed conditions are now expected during the intervals
7-10 October and 17-20 October.

==========

4. IONOSPHERIC DISTURBANCES (for Sydney)
07-09 Sep 96 15-30% depressed at Darwin local daylight hours
14-16 Sep 96 15-30% depressed at Darwin local daylight hours
17 Sep 96 15-30% depressed at Darwin local daylight hours
15% depressed at Sydney, Townsville and Hobart
19 Sep 96 depressed 15-30% Australian region
20 Sep 96 depressed 15-30% at Darwin local daylight hours
near normal at Sydney and Twonsville
depressed 15-30% at Hobart
21 Sep 96 depressed 15-30% northern region
near normal at Sydney
depressed 15-30% at Hobart
27 Sep 96 depressed 15% Darwin and Twonsville
depressed 15-30% Hobart and Sydney region

Frequent depressions were observed during the local
day at Darwin this month.

Depressions at southern region stations were probably in
association with extended periods of geomagnetic activity
observed this month. These more widespread depressions
were observed on 20-21 Spetember and 27 September.

4261. Help tracing old EI-callsign

Newsgroup: rec.radio.amateur.misc
Date: 1996-10-02 00:00:00 UTC
From: emmet@indigo.ie
Message-ID: <52sfft$7r5@niamh.indigo.ie>
Source record: 215746

For many years I have been seeking the callsign held by my late grandfather without success. His name was Alec Caulfield and he was resident at

22(?) Gartan Avenue,
Drumcondra,
Dublin,
Ireland

22(?) Lower Drumcondra Road,
Drumcondra,
Dublin,
Ireland.

during his periods of activity: 1930-1950 (excluding wartime!)

If anyone knows of any information resource or individual or company who might be able to help, I would really appreciate an email. Governmental records here were destroyed in a fire after his death (1952). The Dept. of Communications (equiv FCC), IRTS, RSGB, and ARRL have been unable to help. Any more suggestions?

Thank you for your help,

Emmet, EI7HF.

WestNet DX-Club Member.

4263. Re: DX Club BBS alert doesn't ID.

Newsgroup: rec.radio.amateur.misc
Date: 1996-10-02 00:00:00 UTC
From: bd703@scn.org
Message-ID: <DyMI7L.9EA@scn.org>
Source record: 215748

Previously I wrote:

>
>
>There is a computer generated voice "DX Alert" on the 147.00 repeater
>in Seattle. Apparently this is accessed from a BBS.
>
>This is fine and dandy except that the alert never ID's after keying the
>radio at the owners home. (never gives callsign so I can't tell the owner)
>
>Is there some one who can bring this to the owner's attention and get it
>fixed?
>
>

After monitoring both the output and the input (146.400), I discovered that the alert transmitter DOES give it's callsign (W7LFA) at the BEGINING of the transmission instead of the END.

The ID isn't given EVERY time it keys up (maybe only every 10 minutes?)

I guess the way the system works is a club member acesses the bbs and enters the info about a dx station heard.

The bbs computer will then key the radio on the repeater input and send a voice alert in the following format.

"Whiskey Seven Lima Fox Alpha...DX Alert" (then gives the call of the dx station, and the frequency,then repeats call and freq)

Sometimes it starts with just "DX Alert".

For more info about the Western Washington DX Club visit their Home Page

I didn't say the solutions didn't exist ... I said they were not
currently in use in ham radio ...

>The reason that QSOs/Hz and not bits/Hz is the relevant metric is that human
>beings adapt their information rates to the channel in question, applying
>compression in various forms.

I didn't say bits/Hz ... I said bits/sec/Hz ... that's THE valid metric
.. Morse can be viewed as bits, just as can data, or voice (in
digitized equivalent form, if you like) ... QSOs/Hz makes NO sense ...

>Oddly enough, most of the stated goals of the
>Amateur Service involve direct communications between human beings. Go out
>on 20m sometime, and count the number of human QSOs versus automated links.
>

You keep trying to imply that only computer automated links and not
people can use digital communications ... totally bogus ...

>> The issue is not QSOs per kHz ... that outdated concept panders to the
>> idea that "narrower is better" and ignores the existence of time.
>
>Narrower in the Shannon sense will always be better.

What the hell do you *think* you are talking about??? You obviously
don't *know*, ergo my use of the term *think* ...

>In the end, you still
>have to pack a number of QSOs into the available bandwidth. Incidentally,
>the "wider is better" myth fell out of favor about two years ago.
>

You obviously don't know what the hell you're talking about ... and
you're certainly not in touch with contemporary communications systems
design trends ... why do you think frequency hoppers, CDMA, and other
spread spectrum techniques are so hot in the commercial world???
Wait ... disregard that question ... you'll only confuse *other*
non-technically-inclined readers with another bunch of misimformation
and gobblty-gook ...

>> The way to measure the spectral efficiency of a modulation scheme is with a
>> metric like "bits/sec/Hz" ... this sort of metric recognizes the
>> well-known engineering fact that the absolute bandwidth is totally
>> irrelevant to efficiency.
>
>That assumes that the information rate is independent of the channel rate,
>which is false in this case. In the end, you still have to modulate
>some kind of baseband information into the channel. If the baseband
>information rate is lower, then you will inherently be able to pack more
>users into the available bandwidth.
>

None of what you assert above makes any sense nor fits reality ... the
information rate (source data) and the channel rate (symbols/sec)
certainly can be independent ... in a good system design, they most
likely are ... so it's not clear at all that slower/narrower is
"better" ... may not be ... also, you don't even mention considering
the severity/type of channel impariments and interference ... they may
also tip the scale in one direction or the other ...

>>There have been many examples presented here
>> in the past weeks that clearly show, by simple math, that virtually
>> *every* other mode (except spark) is more spectrally-efficient than OOK
>> Morse, so rather wasting the effort in regurgitating them, I'll refer
>> you to DejaNews or AltaVista ... (assuming you *really* want to see
>> them again, which is dubious ...)
>
>But again, those didn't use relevant metrics. The issue here is whether or
>not the HF bands could handle more *users*, not more bps per Hertz.
>From a bps/Hz perspective, you're correct. But since the user community is
>rate adaptive, your comparison is irrelevant to the original question.
>

Your use of "rate adaptive" would be LAUGHABLE ... IF you were joking.

Throughput in bits/sec/Hz (or equivalent) IS THE relevant metric
.. if you knew ANYTHING about modern comunications system design,
you'd know that simple premise and understand it without trying to pass
off these totally idiotic arguments on those who might not realize how
absurd they are ...

In your scenario, it's "possible" to "support" more users ... they're
"rate adaptive" (ha, ha, ha) ... which means they'll sit by like
twits as throughput drops to zero as more users thrash the same spectrum
with the same tired, old, inefficient techniqes that their granddaddies
used in '27 ... SOME "support" ...

The way you REALLY _support_ more users it to employ modern techniques
that will allow them all to maintain acceptable levels of throughput at
the same time that larger numbers of other users (than presently
supportable at that rate of information transfer) are active ... this
is the opposite premise from yours ...

>So fine. Build them, and we'll believe you. The CW requirement isn't
>stopping anyone from building or deploying such a system.

Yes it is ... many of us can't operate on all of the HF bands ...
there's also the matter of some other needed rules changes to remove
outmoded restrictions on bandwidth, modulation and coding, etc. Those
will be relatively easy to get changed ... the code test will be harder
because so many olde fartz will bitch and moan so loud about progress.

>Until that time, we have to deal with what we have.

No, we don't ... we can get the rules changed ...

>> The FCC WILL make EXACTLY that judgement when deciding to take our bands
>> away and auction them off to some deep-pockets commercial enterprise who
>> proposes to use them to provide valuable, desirable services to
>> *millions* of users. (it's called "the public interest")
>
>Agitprop. The HF bands are not in danger; witness the last full WARC in
>which we actually *gained* in HF. Everyone else is moving to satellite,
>largely because they can afford to.

NO, REALITY ... many commerical users are looking at new technologies
for HF ... and as Gary has eloquently described, there are many
potential uses and advantages to modern HF for them ...

>> The above paragraph shows clearly that you have ABSOLUTELY NO IDEA of
>> how spread spectrum could be (and has been) applied to HF.
>
>Then you can prove that assertion, or discredit yourself.
>

Your OWN COMMENTS prove that you haven't a clue ...

>> I never said "ban CW" ... nor "ban SSB" ... all I've said is:
>
>Oh yes you have. You've repeately called for a mandated change from
>"outdated" technology to something new.

No, I said "Eliminate the mandatory code test and let new technology
flourish instead of maintaining a repressive, backward status quo."

>You've said that price isn't a factor, so the marketplace won't support
>that change.

No, I said "New, dramatically more efficient digital modes need not cost
more than the outdated technology now used by hams."

I also said that dollars of equipment sold were not a valid metric of
the value of ham radio to those who regulate us and grant us our bands.

>With all of those existing
>modes raising the noise floor, your system won't have enough orthogonality
>to function at the level you've claimed. So you're going to have to do
>something.

Again, you simply say "it won't work" ... you have NO IDEA of what I've even got in mind (or what others are/have been inventing/thinking about), so how can you make such sweeping statements ...

>> And I'm not talking "pipe dreams" about "technology that doesn't even
>> exist" ... I'm talking about technology that's being used every day by
>> commercial users ... hell, even *consumer devices* like cordless phones
>> and cellphones ... WAKE UP!!!
>
>Those devices have several hundred megaHertz to chip over. The largest HF
>ham band is a little over 1/100 of that size, and don't have to deal with
>ionospheric fading.

The 902-928 MHz ISM band (where most of the SS consumer stuff is currently living) is, by my calculation, only 26 MHz wide ... unless you know of some mathematical revelation of which the rest of the world is unaware, how does that give those devices "several hundred megaHertz to chip over" ?????

Most of those devices break the band up into a number of logical "channels" of a MHz or so in width (the DS-SS ones, that is) ... the hoppers have to hop a minimum of 25 channels (used to be 50) with typical hopping channel bandwidths of less. So these devices are operating in a MHz or so ... at a given time ...

>For that matter, what do you want with HF anyway? Industry has concluded that
>HF is "obsolete", and is moving to satellites. By your methodology, we
>should just give up HF cold turkey and go to satellites.
>

Not so ... just because YOU don't know what's going on and what the trends for the future of communications look like, doesn't change the reality ... any more than saying "CW is the best" over and over doesn't make it so ... no matter how many times you say it, nor how yo click your heels together ...

Hi Jamie,

APRS will probably get more activity with the press it received in Sept QST Digital Dimension article. I ftp'd the program from aprs.rutgers.edu. Now I'm gonna print the user guide to see what all I can do with it. I live in the Philadelphia area. I'm not sure if there is any activity around here. I do see lots of activity in 2 land on 145.790.

Then you are indeed more optimistic than me (in a negative way). While I
can't see the sense in examing Morse unless continued knowledge of and/or
use of it is a REQUIREMENT after the exam, I don't see that there will be
"millions of new hams" flooding the bands if it goes.

I haven't seen any concrete figures to support such an increase in the
upper bands where the Morse exam is no required now. There may be an
initial surge of existing amateurs moving to the HF band, but this will
be a transient phenomena. What leads you to think that this great mass
of people is circling the AR wagon, ready to invade? Most figures I've
seen indicate a decreasing interest in AR, on a percentage of population
basis. I don't even think that CB is suffering from an explosion of users.

I don't see the purpose of the licence as a socio-filter. I see it as a device to ensure that people have at least the minimum amount of knowledge required comply with the licence requirements after the licence is issued. If the standard is higher than that, it is too high, if it is too low it is inadequate for its purpose.

In any event, I don't recall passing a comment on what standard the exam should be. All I can recall saying in any of the message is that the question of what level the exam should be is another matter.

Well today is day 10 of the big wait! I hope the FCC was ready
for this influx of applications. I was thinking, if it takes oh,
say, 2 weeks per day of applications then if your application was
received Friday Sept 27th you should see your results around
Dec 25th. =)

Merry Christmas.

Oh well, I am just hoping that the FCC is spending some of that
$30.00 per application for some overtime for the data entry clerks
to help them keep up. Spread the wealth, if you will.

Sitting here and waiting (on day T+10 and counting...)

: To the original poster: I too enjoy the occasional 2m tropo contact.
: Great fun.

I agree, Robert. When I first got my ticket, I made a 200+ mile simplex "keyboard QSO" tropo contact on 2 meter Packet, just using a HT and a wire dipole. To me this was just as exciting as when I later worked CO and NM from Southern California during a rare sporadic-e opening on 2 meter SSB.

The ham op who only has a $200 Radio Shack HT and a groundplane made from coat hangers can have just as much fun & enjoyment as the $10,000 superstation.

I too have sent flaming responses to some of Drew's obnoxious messages in the past, but he seems to have mellowed out in the past few months.

>length codes are more efficient than fixed length codes if the
>probability of the symbols is not equal.

Not necessarily. The encoded string is shorter (for average text)
with the variable length encoding, but in a noisy environment, the
probability of correct decoding is lesser for the variable length
encoding than for a uniform coding.

One of the strengths of uniform codes is that the positions of the
bit centers are completely predictable a priori. That allows optimum
recovery of bit energy, which in turn increases correct decoding
probability in the presence of noise.

A uniform code uses a transmitter's energy more efficiently due to
less "waste" at the receiver, thus allowing lower power operation,
and, due to the lower number of errors, thus requiring fewer repeats,
less total time is required to receive the message correctly. So
a uniform encoding allows both better power efficiency and better
time efficiency than a variable length encoding.

Never used MBBIOS under WIN95 but have used other DOS com drivers.
Delete the reference to COM2: in the system setup, device drivers
section (under ports, COM2:). If WIN95 doesn't know its there, then
it shouldn't object to MBBIOS grabbing it.

Hi Cecil, I'm simply comparing turning on and off a xmtr as opposed to
sampling an analog wave and transmitting it using a CRC protocol of some
type, and then decoding it at the other end. By far, Digital is a better
(+-error free) method of xmting. But which is simpler? Let's not bring
Integrated Circuits into this because one chip I know of can transmit FM
at 65mW. One chip and it's a tranmitter.

You're a "digital" person, look at this analogy.

Radio components are equal to commands of a programming
language. Using commands you build a program (= radio).

Which transmitter would require the least amount of instructions
to build?

Howard,

I wrote the post about ADSL. I was replying to a post wherein it was claimed that CW mode was obsolete technology and should be dropped. My point was that obsolescence is relative. For instance, according to this absurd logic, after the wheel was invented, walking became obsolete. After the automobile, the horse became obsolete. After the airplane, the automobile became obsolete. I carried this absurdity one step further, to further make my point. I said, "High speed digital communications will become so easy and cheap in the next few years, even the most advanced SS HF radio amateur modes will be obsolete by comparison of cost/performance." I never said or intended to say anything else or make any other use of the analogy.

In fact, walking did not become obsolete, just because a sometimes faster, more efficient means of transport came along. Sometimes it is faster and more efficient to walk than ride in a vehicle.

Horses did not become obsolete after automobiles came along. There are areas where riding horseback remains the most efficient means of transportation.

And of course, while airplanes are far more efficient than automobiles in terms of hauling people farther faster, they have not rendered automobiles obsolete, because of the relative difference between the modes. Neither have other communication modes, some perhaps even more efficient than CW, rendered CW obsolete. Everything is relative.

Negativland...are there any other hams out there who love these guys?
I'm sure there must be some of you in the Bay Area at least.

I highly recommend Negativland's "Over the Edge vol. 1", JamCon 84. It's an audio presentation of a "documentary on ham jammers" and it's pretty hilarious. It's quite bizarre though, some will hate it, but I'm sure most any ham would find it interesting at least. Look in the alternative section at the record store (if they separate those out from the rest of the pop music).

It's wonderful bureaucratic world isn't it! I left MARS when someone decided that you must work HF to be in MARS and I didn't get home from work in time to meet the HF net. The thinking then was that "hi-tech" microprocessor controlled VHF teletype links of the time were not needed, HF SSB or CW was the thing. Now we don't need CW because we have "hi-tech" digital modes and SSB, I suppose.

But Frank, that's the whole point of what I'm saying. Nowadays, one integrated circuit chip is just as easy to have in your junkbox as a transistor or tube and it is a heck of a lot easier to design with than discrete components. A professional designer designed it and a professional manufacturer manufactured it. All we have to do is understand how to interface it to the external world and we have a near-perfect system design, something few of us are capable of with discrete designs.

> Which transmitter would require the least amount of instructions
> to build?

Using high-level instructions, the digital transmitter would require the least amount of instructions. Most electronics are getting to a higher and higher level of hardware and software integration thereby making it easier for ordinary hams to take advantage of the latest technological developments. That the average ham is not doing so is just an indication of being stuck in the electronic dark ages.

The 2nd Call for Votes for the new newsgroup has been posted.
If you have not voted yet please vote now (especially if you
are planning to vote YES !).

Vote by sending email to rrab@infobahn.net
And put this is the body of your message (If you are voting affirmatively)

I vote YES on rec.radio.amateur.boatanchors

It takes only a few seconds so do it now. You vote counts heavily
because we need 100 more YES votes than NO votes to pass. We have no
idea how many votes we have and it would be a shame to see the
vote fail because we only got 99 votes!

pse, pse, OM, vote now.
tnx 100 times.

Source record: 215634

I'm a tech-plus and have just passed my 13 word-per-minute code test. I know that the certificate of completion for the 13 wpm code test is good for one year. Assuming I pass the general class written exam within a year, is there some time limit for taking and passing the advanced class exam? For instance, suppose I take and pass the advanced class exam five years later. Will I have to retake the 13 wpm code test?

The /7 means the operator is operating in US Region 7.
The /AE means the operator recently passed the extra class license exam(s) and is operating with extra privilges prior to FCC licence issuance. Actually, you would not hear K0BB/AE as K0BB is a 1x2 extra call sign already. A better example would have been KB0BBB/AE. (Sorry for being nitpicky!).

ARLB069: FCC Gate 2 update

SB QST @ ARL $ARLB069
ARLB069 FCC Gate 2 update

ZCZC AG49
QST de W1AW
ARRL Bulletin 69 ARLB069
From ARRL Headquarters
Newington CT October 3, 1996
To all radio amateurs

SB QST ARL ARLB069
ARLB069 FCC Gate 2 update

If all goes well at the FCC's Gettysburg, Pennsylvania, office, you might have that new vanity call sign you applied for under Gate 2 in time for the ARRL Sweepstakes CW weekend (November 2-3). A spokesman said this week that the FCC anticipates it could be four weeks or so before any grants are issued to first-day applicants. The FCC said the number of personnel available to enter application information and call sign lists is limited, and that keying in up to 25 call signs and then verifying that they were keyed correctly is not a very fast process.

The FCC will not start making any grants for first-day filers until all day-one applications have been entered into the FCC's computer. Then applications will be processed randomly from among those in the first-day pool.

The number of hams taking advantage of Gate 2 has been less than anticipated. As of September 25, the FCC had received 5297 Gate 2 applications. First-day vanity filers totaled 4527, a number that even surprised the FCC, which had been expecting a larger flood of Gate 2 filings. The FCC said 4188 paper applications and 339 electronic applications were received the first day. Another 770 applications, mostly paper, had showed up by Wednesday, September 25. Slightly more than 7 percent of applicants used the FCC's newly inaugurated electronic filing system.

Among the major headaches for the folks in Gettysburg are applications that contain illegible information. FCC personnel have been instructed to skip over requested call signs they cannot decipher. Also, some electronic filers have been sending their payments to the wrong Post Office Box in Pittsburgh and using the FCC Form 159 designed for use by those filing on paper. The FCC said

that contrary to instructions on the electronic application form, electronic filers should not forward a copy of their Amateur Radio license to the FCC by mail. FCC personnel have no way to match up licenses with applications, and they don't need the license copy to process the application.

The FCC said that some applicants apparently have had second thoughts about changing their call signs and have contacted the FCC to pull their Gate 2 paperwork. The FCC says that cannot be done. Those issued a vanity call sign who decide they like their old call sign better will have to pay another 30 dollars and reapply under Gate 1.

If the FCC is unable to grant any of your vanity call sign requests, your application will be dismissed, and the FCC will notify you to that effect. But the Commission will not return your 30 dollar application fee until you request a refund in writing. Unlucky vanity applicants will be informed that ''credit cannot be provided toward future filings,'' and that FCC procedures authorize a refund ''only when requested in writing.'' To take another chance under Gate 2 means completing another Form 610V and sending in another 30 dollar fee.

The FCC has not announced a schedule to open Gates 3 and 4.

Big help you are...

Gary, once you obtain your General license you will have permanent
(well, at least as long as you keep your license current) credit for
your 13 WPM code test. All you will then need will be to pass the
Advanced written test for your Advanced license--even if it takes you 20
years to do it.

Congrats on passing your test and good luck with your upgrades.

73, Dick

From what I understand the $30.00 is the license fee for 10 years (in
advance). I believe that all those with vanity calls will have to pay
again upon renewal.

You heard correctly! We'll assume the charger you are talking about is a 1/10c (charges at 1/10 of the amp/hour rating of the pack). 12 to 14 hours is optimum. Occasional overcharging at this rate won't cause any problems, but if left on continously you will shorten the life of the pack due to drying out the electrolyte. You may also cause what is known as Voltage Depression. Voltage depression is the lowering of the cell voltage due to overcharge. This results in the pack reaching it's cut off voltage sooner than would be expected.

Some fancy chargers drop to a trickle (maintance) charge rate of about 1/100c after the pack reaches full charge. If that is the case, then you are safe to leave the battery on charge.

If you are in the market for a charger, look for one that uses reverse, or negative pulse charging technology. That type of charger can extend useful life of nicads out to over 1000 charge/discharge cycles.

4315. Mast for vertical Yagi

Newsgroup: rec.radio.amateur.misc
Date: 1996-10-03 00:00:00 UTC
From: gary@carcs1.wustl.edu
Message-ID: <5315b2$ajq@lex.zippo.com>
Source record: 215649

I'd like to put a 2-meter Yagi antenna on the roof of my house. I need
to polarize it vertically. If I do that, I don't think I can use steel
or aluminum masts, because they'll interfere with the operation of the Yagi.
Am I correct? If I am, does anyone have any suggestions?

- Gary KB0QGE

4316. Info QRP SWR brg ?

Newsgroup: rec.radio.amateur.misc
Date: 1996-10-03 00:00:00 UTC

Why not apply that logic to every other mode. The ham who has never learned and used >>INSERT ANYTHING YOU LIKE BUT OTHERS MAY NOT, HERE<< on the air will never realize the attractiveness of the mode.

Is that why mechanical RTTY isn't as popular anymore? Should we make everyone stip down and rebuild a teleprinter so that they know the attractiveness of it?

Because some people will never realise what fun a mode (any mode) is not a valid reason for making it an examinable licence exam topic. Licence exams should test what the amateur is required to know and/or do after the licence has been granted. It should not be about what someone or some group thinks is attractive.

This seems to be a case of where you believe that the hobby cannot show that Morse serves a useful or interesting purpose (to some people). Even I don't believe that.

Anarchy will distroy this newsgroup. .Policy was created to take the code debate off of this group. How can we respect your views when you won't even respect the rec.radio.amateur charter that governs these groups?

In each of my responses to your anti-code fantasies I place rrap in the header's "followup-to" line, but you always delete it. You're playing the role of a big bully; you're a perfect example why so many groups are becoming moderated.

Your newsgroup behavior aligns perfectly with your call for removing the sub-band plans - the louder and more obnoxious will be the victor.

Be honest yourself, Carl: Tell us once and for all what class license you hold; you always say "I've passed a code test" & "I've got HF privileges", but not once do I recall you stating what your license class is. Don't be ashamed.

If you want others to be honest, you too have to be honest and play fair (such as following the newsgroup's charter and keeping the code debate on .policy).

>

Paul,

I think you've hit on something ... many (not all) in the old guard
can't face the possibility of having to admit (to themselves, at least)
that the tests that they passed are "no big deal" ... they have to have
a way (the code test) to convince themselves that there's something
"special" about them, since they know (deep in their hearts) that the
written tests are a joke and they memorized the answers anyway to squeak
by with a 75% score ...

As one pro-code fanatic said they can't stand the thought of losing
their "bragging rights" ...

This is clearly NOT a valid, compelling reason for maintaining a
backward status quo ...

4324. SIERRA SEMICONDUCTOR ANNOUNCES EXIT FROM MODEM CHIP SET

Newsgroup: rec.radio.amateur.misc
Date: 1996-10-03 00:00:00 UTC
From: DAVE ABSHIRE <D.R.ABSHIRE@worldnet.att.net>
Message-ID: <01bbb0cc$e4eee8e0$2a5292cf@default>
Source record: 215675

SIERRA SEMICONDUCTOR ANNOUNCES EXIT FROM MODEM CHIP SET BUSINESS AND EARNINGS CHARGE OF $50-80 MILLION

Company to concentrate on networking and infrastructure semiconductor markets

SAN JOSE, CA --- August 28, 1996 --- Sierra Semiconductor Corporation (Nasdaq: SERA) today announced its intention to exit from the Modem chipset business and to focus on its existing Networking and Infrastructure semiconductor businesses. As a result of this decision, the Modem chipset product line has been put up for sale. This action will result in a one-time charge to earnings in the quarter ending September 30, 1996, of approximately $50 Million to $80 Million.

"The decision to no longer participate in Modem chipset products is based on the status of the PC Modem business today, as well as Sierra's long term goals as a company," said James V. Diller, chairman and CEO.

"As we have stated in the past, competition in the Modem chip business is increasing, placing pressure on prices and margins. In the last few months the overall market conditions for Modem chipsets has deteriorated significantly. We continue to see excess inventory in the distribution channel and excess capacity in the supply base. This is resulting in rapidly declining prices and corresponding declines in margins. Sierra does not see evidence that these trends will reverse, which implies that structural rather than cyclical changes have occurred in the Modem chipset market. Given this change in market dynamics, we believe it is in the best interests of Sierra and its shareholders to discontinue investing in this segment of the Company.

"Instead we intend to focus our energies and our resources on our Infrastructure and Networking product lines, where we believe Sierra holds a leadership product position. The Networking semiconductor market, in particular, has experienced significant growth during the last few years, and industry analysts have projected future growth in demand for Networking chips and chipsets. Sierra believes that its current position within this market offers a significant opportunity for future growth which represents a far better investment opportunity for Sierra long term," said Diller.

As part of Sierra's effort to sell the Modem chipset business, the Company will continue to operate this business segment and has committed to continue to provide customer support in the longer term. James Diller will assume the day to day responsibilities of Richard J. Koeltl, Sierra's president and COO, who will be leaving the Company.

The amount of the third fiscal quarter one-time charge depends on a number of factors which will be determined during September 1996 and will be publicly announced as part of Sierra's third quarter earnings release, currently scheduled for the third week of October 1996.

This press release contains forward-looking statements within the meaning of Section 27A of the Securities Act of 1933 and Section 21E of the Securities Exchange Act of 1934 which are subject to risks and uncertainties. Forward-looking statements which relate to increasing competition in the Modem chip business, estimates of modem chipset inventories and supply capacity, projections of Modem chipset pricing and the prospects for changes in these trends are subject to the quality and quantity of market information available to Sierra and changes in these market factors. Accordingly, there can be no assurance that any of these projected trends or events will occur. Forward-looking statements which relate to future growth in demand for Networking chips and chipsets, Sierra's position in the market for these products and the opportunities for Sierra in this market are subject to factors such as industry-wide demand for Networking equipment and the pricing of Networking semiconductor devices, the adoption of new technologies, Sierra's development of additional products and the actions of competitors. Sierra's Quarterly Report on Form 10Q filed with the Securities and Exchange Commission contains additional discussion of the risks and uncertainties relating to the Modem, Networking and Infrastructure markets. Forward-looking statements concerning the estimated range of the third-quarter charge to earnings are subject to factors such as the value of the Modem chipset business, write-offs related to inventory, fixed assets and personnel. Actual results could differ from those projected in any forward-looking statements for the reasons set forth above or in the Company's Form 10Q report.

I have an Icom IC-R71A Short-wave receiver for sale with matching Icom speaker IC-SP3 external speaker and Icom RC-11 remote control. I am also including the Autek Research QF1A SSb/AM/CW filter.

Condition of the Icom IC-R71A is exceptional. No blemishes, scratches, etc. Speaker and peripherals are like new including the QF-1A from Autek Research.

The Icom IC-R71A covers 100Khz-30 Mhz
100 Db of dynamic range
Passband tuning
Adjustable notch filter
Level and pulse width
Selectable noise blanker
Selectable AGC
Filter switches
Keyboard frequency entry
SSB, AM, CW, RTTY and optional FM
32 memory channels
optional CW narrow filters

The package price ids $775.00 Transaction via UPS COD. {Free shipping UPS COD via UPS regular to CONUS}
The Package is "not" being broken up

Keith,
A .wav file is a sound file. You need a computer with Windows and a sound
card to listen to it.

In Canada station license fees have to be paid every year by March 31st. If this is not paid the station license is not valid and a person operating without a valid license is operating illegally. If you don't pay before the deadline you have to pay more to renew the license. If the license fee is not paid within a year it is cancelled and the callsign could be reassigned.

Fred, with Windows 3.1, we had to load the BPQ TSR's before we
started Windows. I am not sure you can do that with 95, as I haven't bothered
to upgrade to it.

Allen-Bradley AB and Ohmite type J industrial pots are very high quality items. They use, I think, a graphite brush for a wiping contact on composition elements, rather than a metal brush on a deposited carbon element.

HP and Tek gear uses these. Need I say more?

Take five minutes to read this and it WILL change your life.

I just read an article in an internet newsgroup describing how
to make $50,000.00 in only one month from a $5.00 investment.

Of course I thought this was rediculous ,or some type of pyramid.
I talked it over with my family, an attorney, and my friends, and
they all agreed it was some sort of scam.I hate scams because
usually someone gets burned, and I didn't want it to be me!
I blew it off for a few weeks then saw another one in a
newsgroup I go to alot and thought, "Maybe this is legitimate!".
Besides, whats $5.00 , I spend more than that in the morning on
my way to work on coffee and cigs for the day.

Well, two weeks later,I began recieving money in the mail!
I couldn't believe it! Not just a little , I mean big bucks!
At first only a few hundred dollars, then a week later, a
couple of thousand , then BOOM . By the end of the fourth
week , I had recieved nearly $47,000.00. It came from all
over the world.And every bit of it perfectly legal and on the
up and up. I've been able to pay off all my bills and still had
enough left over for a nice vacation for me and my family.

Not only does it work for me, it works for other folks as well.
Markus Valppu says he made $57,883 in four weeks. Dave Manning
claims he
made $53,664 in the same amount of time. Dan Shepstone says it was
only
$17,000 for him. Do I know these folks? No, but when I read how they
say they did it, it made sense to me. Enough sense that I'm taking a
similar chance with $5 of my own money. Not a big chance, I
admit--but
one with incredible potential, because $5 is all anyone ever invests
in
this system. Period. That's all Markus, Dave, or Dan invested, yet
their $5 netted them tens of thousands of dollars each, in a safe,
legal,
completely legitimate way. Here's how it works in 3 easy steps:

STEP 1.

Invest your $5 by writing your name and address on five seperate
pieces
of paper along with the words, "PLEASE ADD ME TO YOUR MAILING LIST."
(In
this way, you're not just sending a dollar to someone; you're paying

for
a legitimate service.) Fold a $1 bill, money order, or bank note
inside
each paper, and mail them by standard U. S. Mail to the following five
addresses:

1. Olivier Arcadipane
237 rue Francois Andre
7390 Quaregnon, Belgium

2. Marco Monet
409 N.E. 107 St.
Miami, Florida, USA 33161

3. Edwin Su
680 Sylvan Ave, #11
Mountain View, CA 94041 USA

4. Toby Vaught
203 Barringer Hall
Blacksburg, VA 24060

5. Carol Ann Bissonnette
115 Tavistock Street
Springfield, MA 01119-1215 USA

STEP 2.

Now remove the top name from the list, and move the
other names up.This way, #5 becomes #4 and so on.
Put your name in as the fifth one on the list.

STEP 3.

Post the article to at least 200 newsgroups. There are at
least 17000 newsgroups at any given moment in time.
Try posting to as many newsgroups as you can.Remember
the more groups you post to, the more people will see your
article and send you cash!

STEP 4.

You are now in business for yourself, and should start seeing
returns within 7 to 14 days! Remember, the internet is new
and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 200 posts I made, I got back 5 responses.
Yes, thats right,only 5. You make $5.00 in cash, not checks or
money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 200
additional postings with your name at #4, 1000 postings.On
average then, 50 people will send you $1.00 with your name at

#4,....$50.00 in your pocket!

Now these 50 new people will make 200 postings each with your name at #3 or 10,000 postings. Average return, 500 people= $500. They make 200 postings each with your name at #2= 100,000 postings=5000 returns at $1.00 each=$5,000.00 in cash!

Finally, 5,000 people make 200 postings each with your name at #1 and you get a return of $50,000 before your name drops off the list.And that's only if everyone down the line makes only 200 postings each! Your total income for this one cycle is $55,000.

From time to time when you see your name is no longer on the list, you take the latest posting you can find and start all over again.

So thats it. Pretty simple sounding stuff, huh? But believe me, it works. There are millions of people surfing the net every day, all day, all over the world. And 100,000 new people get on the net every day. You know that, you've seen the stories in the paper. So, my friend, read and follow the simple instructions and play fair. Thats the key, and thats all there is to it.Print this out right now so you can refer back to this article easily.Try to keep an eye on all the postings you made to make sure everyone is playing fairly. You know where your name should be.

REMEMBER....HONESTY IS THE BEST POLICY.YOU DON'T
NEED TO CHEAT THE BASIC IDEA TO MAKE THE MONEY!
GOOD LUCK TO ALL,AND PLEASE PLAY FAIR AND YOU WILL
WIN AND MAKE SOME REAL INSTANT FREE CASH!

* SLMR 2.1a * Curiosity didn't kill the cat, it was my hammer!

I guess to some of us the opening of Gate 2 is a big deal. We think
that the FCC is swamped with first day 610-V forms. I visualized a dozen
typists working overtime for three weeks to catch up. Then I looked at the
numbers, and was shocked at the real thru-put! At 20 wpm, one cw op would
finish the input task a week ahead of the FCC staff assigned to the job. The
FCC's real problem is reading the handwritten callsigns through the rings of
coffee stains on the forms! <g> If we had sunspots, who'd have time to fret
about the FCC? Better spots and better bands will be here in a few years. I
sure hope to have a call to match.

>of a IC3220. I want to listen to 460-470 MHZ.
>The sensitivity is dramatically!!!
You need to figure a way to keep the Amateur radio front end alive as it switches off at 450 Mhz. One the 3220 is below 440 or above 450 Mhz a fixed tuned front end is turned on. The Amateur radio front is wide enough to work to about 470 Mhz. ICOM does not have any information on how to switch the amateur front end back on so you are on your own.

Nicad batteries are considered to be enviormentally hazardous so the United States places real high duties on them for import so your $ 2 to 5 price is off mark here. Maybe if the batteries were made in the U.S. it might be cheaper. Now that many states are requireing the owner of Nicads to go to a Hazmat center fro proper disposal of Nicads, may times it costs one to throw away the Nicads also if the manufacturer has to bear the cost of disposal, the cost goes up. if you were selling batteries at $ 5.00 and the state of A;aska was charging you $ 2.00 to dispose the batteries, it is doubtful you would still be selling them for $ 5.00.

Gary

Sorry to reply to my own post, but it just dawned on me the real reason for why it's taking so long for Gate 2 calls to be processed is just the delay for the checks to clear! Free stuff just zips through the FCC's system.

Who might these "old guard" people be, Carl? Please post names and quotes
to support this claim.

My reading experiences are just the opposite of yours. I believe most of
us "pro-coders" know full well that the theory exams are next to useless.
We've stated it numerous times, in calling for tougher theory exams before
we'd consider eliminating the code examination.

Well said Jim...but given Geralds actions, Im sure its falling on deaf ears, and he will probably hurl threats at you, and contact your ISP.

Another thing he could do is discuss the issue as an adult, site and share proofs, and even civily debate the issue(s)...but that would not fit his selfish, arogant style.

Immaturity isnt something that can be taught...and unfortunatly...it doesnt appear that it will ever be attained by some.

I will respect the oher users of this forum, and not comment on the matter further.

Take care all.

A test sounds like a good idea, Jim. But the contentless contacts
you suggest smell like Dx gaming to me. The purpose of communications
is to communicate, so I suggest we have something to say. Some of
my digital operator friends and I chirped this test idea over on the
air after I shared your message with them. We agreed that what we
need is some standard text to exchange for the test.

So, after a bit of debate, we decided that we'd just use this message
that you're reading now, verbatim, including the RFC822 header and the
sig, as the test message. What we propose is that I will contact as many
amateurs in as many ITU countries as possible via digital modes, pass this
message to them, and ask them to mail it to their nation's telecommunication
authority responsible for WRC-99 planning. You do the same via CW.

I agreed to mail a copy of the message to each administration with a
cover letter so that they would have a check text to compare with the
copies received from amateurs in their countries. This will allow
them to see how efficiently and accurately their nation's amateurs
can handle messages with greater than trivial content using various
text transmission methods. Each forwarding amateur should note below
the sig of the message the time, date, and mode used to receive the
message.

If you are agreeable to this test, I propose that it start on November
1, 1996 and run through November 30, 1996. We'll let the world's
telecommunications regulators be the judges of the test. I know there
are amateurs with digital capability in at least 200 ITU countries,
because I've worked that many. I assume that there are amateurs with
Morse capability in all ITU countries. That gives you an edge. Lets
see what you can make of it. Remember, the message must be delivered
verbatim to count.

I wouldn't worry about it, Gary. From all indications, the Morse
requirement will be nothing but an antiquated memory five years from now.
The ITU will elimanate the international requirement in 1999 (if not
before), and the individual countries will immediately follow suit.

So, in other words, you don't wanna play. Not with my rules, anyway.
I hadn't envisioned testing the capability of a mode to pass long text messages.
Certainly digital modes are better for passing long text messages, Gary, as long
as you pass them point to point and keep them away from BBS systems so they
don't get lost.

The purpose of communications is to communicate..... Has the sole purpose of ham radio become passing long text messages on HF ? Is 'DX gaming' no longer a facet of the hobby that attracts many hams worldwide ?

What I had envisioned was a rather short test to see if the statements about 'nobody is using CW anymore' and 'digital modes are more popular' are true. Which I could easily win.

What you envision is a test of passing a large amount of data to see if the the statements 'digital modes are more effective' than CW are true. Which you would easily win.

You obviously agree that I can make 500 contacts on CW much faster than you can make 500 contacts on Pactor or Clover. And I agree that you can pass long text messages on Pactor or Clover much easier than I can on CW.

So do we both agree that CW and the digital modes have different purposes on HF as they pertain to amateur radio, and that each would excell under certain conditions ? Or do we only agree that he who makes the rules wins the test ?

73, Jim KH2D

are announced)

4362. VE session in Northern NJ

Newsgroup: rec.radio.amateur.misc
Date: 1996-10-04 00:00:00 UTC
From: kroser@pobox.com
Message-ID: <3254779c.1820976@news.openix.com>
Source record: 215514

The Morris & Essex Amateur Radio Club (MEARC) and the West Essex Amateur Radio Club (WEARC) will jointly conduct Amateur Radio examinations on the third Tuesday of every month, 7:00 PM, at the Essex Fells Service Building, 2nd floor, 307 Runnymede Rd, Essex Fells, NJ. Exams for all license classes will be administered by volunteer examiners certified by the American Radio Relay League (ARRL). Pre-registration is requested.

For more information and registration, call
Ken Roser at 201-377-4776 or Ken Spingarn at 201-377-1997

Tune into the MEARC Verona repeater, 448.875 (-5 MHz in), PL 151.4 Hz, for talk-in and announcements on the test sessions.

Next session: 10/15/96.

INSTRUCTIONS:
1. If you already hold an Amateur Radio license you must bring your CURRENT ORIGINAL license and a PHOTOCOPY (FCC requirement). The original license will be returned to you immediately since only the photocopy of your license is attached to your application form; without your original FCC license, the VE team can not provide you with temporary upgrade credit at the session even if you successfully complete the necessary element(s)
2. At least one pencil (#2 lead) and a suitable eraser
3. An ink pen
4. A PHOTO ID or any two forms of positive identification (FCC requirement) from this list (your cooperation in providing proper identification is appreciated):
- non-photo driver's license or other ID card (school or employer)
- birth certificate (with appropriate seal)
- passport
- minor's work permit
- any business or personal correspondence addressed to you
5. To receive credit for either a code or written element you have previously passed, you must bring the ORIGINAL and a PHOTOCOPY of your Certificate of Successful Completion of Examination (CSCE). The CSCE must have been issued within the past 365 days and can be from any VEC. Photocopies alone are not acceptable
6. Some electronic calculators (including programmable are allowed). Be prepared to demonstrate to the administering VE Team that all calculator memories have been cleared and that it has no built-in formulas (p is okay). They may otherwise have to deny you the use of your calculator.
7. Scratch paper and code copy sheets are provided. All notes made

during the test must remain with the test papers. Certificates for code, written and upgrade credit will be issued at the session.
8. For 1996, the test fee for all elements except for element 1A (5 WPM code) and element 2 (Novice written) is $6.05. There is no test fee for elements 1A and 2. Please bring either a check or money order made out to ARRL VEC or exact change as the VE team may not be able to make change.
9. PHYSICALLY HANDICAPPED PERSONS, including those with severe hearing loss, should read the instructions attached to FCC Form 610 regarding the "Physician's Certification of Disability" section of the application. Also, if special testing procedures are required (see FCC Section 97.26{g}), please notify the VE Team Contact Person immediately to help the VE Team maybe any special preparations for you. Contact the VE Team for details.

DIRECTIONS:
Test sessions are held at the Essex Fells Service building, 2nd floor, 307 Runnymede Rd, Essex Fells, NJ

From Route 280:
Take Route 280 (east or west) to exit 5B, then northbound on Livingston Avenue to the end. Turn right onto Eagle Rock Avenue. At the next light turn left onto Roseland Avenue. Proceed .8 miles on Roseland Avenue and turn left onto Borough Place (police station and church on corner). Go to stop sign and turn left onto Runnymede. Take Runnymede under the railroad bridge and service building is on the left just as Runnymede makes a sharp turn to the right. The service building is a brightly lit Tudor style building.

From Eisenhower Parkway:
Take Eisenhower Parkway to Eagle Rock Avenue (Exxon and Mobil stations on corner). Proceed 1.8 miles and turn left onto Roseland Avenue. Proceed .8 miles on Roseland Avenue and turn left onto Borough Place (police station and church on corner). Go to stop sign and turn left onto Runnymede. Take Runnymede under the railroad bridge and service building is on the left just as Runnymede makes a sharp turn to the right. The service building is a brightly lit Tudor style building.

From Bloomfield Avenue:
Take Bloomfield Avenue to Roseland Avenue. Proceed .8 miles on Roseland Avenue and turn right onto Borough Place (police station and church on corner). Go to stop sign and turn left onto Runnymede. Take Runnymede under the railroad bridge and service building is on the left just as Runnymede makes a sharp turn to the right. The service building is a brightly lit Tudor style building.

Unless I am totally mistaken, the 1 year deal applies ONLY to theory tests. The code test is good forever. For example, lets say you pass the 20 wpm when you go for general and you don't take the theory test for extra for a couple of years, then you would NOT have to take another code test. Anybody feel free to correct me if I am wrong, but I'm pretty certain I am right. :>

Drew, I have never been one of those who have flamed you for your opinions, although I have been reading them regularly, but that answer was kind of rediculous. It gave Gary NO useful info and although I wouldn't mind seeing the code requirements lessened, I am afraid you are in for a BIG disappointment. It is FAR from a certainty that the ITU will eliminate it, and it will almost certainly NOT be an immediate followup from the member nations even if it does.

4371. SBPMorse experiences?

Newsgroup: rec.radio.amateur.misc
Date: 1996-10-04 00:00:00 UTC
From: D G Poulet <D.G.Poulet@durham.ac.uk>
Message-ID: <532ruc$kq2@mercury.dur.ac.uk>
Source record: 215523

Hi,

I've recently got a copy of SBPMorse to see how effective it is. I've got the headphone socket of my ageing R210 hooked up to the line-in of the Sound Blaster card, and I'm monitoring the signal through the headphone socket on the card itself.

Anyway, to cut a long story short, after tuning in to a strong, reasonably clear slow morse signal the program just sits there and does nothing. I've tried all sorts of combinations - varying the input "volume", trying the mic input, using different morse signals etc - all with the same result. The program gives no indication that its receiving anything at all. Has anyone else had experience with this package that could give me some pointers?

Thanks

David

I understand where you are comming from, Cecil, however I am not of the same school of thought. I'm more the type that would design a compiler rather than use it to compile code.

I preffer assembly (machine) language when designing small programms. That's me. Personally I don't mind that there are programmers that use a 3GL or C++ or whatever. It's there, use it.

Using microchips as black boxes is not the reason I got into this hobby. I enjoy using them, but must understand them. Let's face it, when I put a pc together I don't build all my own logic gates! I buy chips. But I know how they work and respect the fact that they are complicated and I cannot build them this way.

That is in essence what I'm am trying to convey (perhaps not as clearly as some would like.) I understand Digitial Comms but respect the fact that they are more complicated (and better) than what I can build from scratch. I can't build a car from scratch either, but I drive one everyday. (too lazy to bicycle when it is -32 here in Canada).

See you.

>What do the suffixes attached to amateur call signs mean?
>For instance, the "7" in "KA0AAA/7", or the "AE" in "K0BB/AE"?

>- Gary KB0QGE

Gary,
The /7 means that KA0AAA is operating portable somewhere in the 7th call area. It is not required to do use the /7, but some stations do it. For example, if I was operating from California, I could sign KH2D or KH2D/W6 which would let people who hear me know where I am without asking. At one time, you could tell where someone was by his or her callsign, but not any more.
The /AE means Amateur Extra, and is used by someone who just passed an upgrade test and is waiting for a permanent license. /AG would mean Amateur General. I'm not really sure if this system is still in place now either.
You will also see callsigns with what you call the 'suffix' moved to the front of the call. For example, I have a friend here is Guam who signs his call as KH2/VP9BP.
You will run into a few more, such as /M (mobile) or /MM (maritime mobile, on a ship). Some stations in Europe use /P (portable).

Hope that helps.

Gary,

No, you won't have to retake the 13 wpm for advanced. To upgrade
from general to advanced, all that is required is the advanced written
exam.

Gary, technically speaking, the metal mast would probably have some effect
on the antenna, but minimal. We all use metal masts for antennas. For a
crossboom on satellite antennas, my friend came up with a piece of heavy
PVC pipe (hot water type, I think) with a wooden closet pole inside to make
it a bit stiffer. I use that idea for several years to support VHF/UHF yagis.

This did not answer his question. Your 13 wpm code test is valid for
the 1-yr period during which you are studying to upgrade to general (or
higher). Once you make general, you only have to take a written test to
move to advanced. Another code test (20 wpm) and written test are
required for extra. Making general class opens up the HF spectrum to
you. Contesting, Dxing and other HF activities are a lot of fun! Hang
in there and good luck on the written testing process.

>smacks of elitism.

I'd say Carl merely recognizes that even advanced methods are relatively
inexpensive to implement today. Therefore relative equipment costs are
no longer an important factor.

>> (value_of_activity*number_of_users)/(spectral_efficiency)
>
>Buried in this equation is a very dangerous idea: that some QSOs are more
>valuable than others, an idea wholly repugnant to the First Amendment.

I don't know how the First Amendment enters into this, but there are
certainly differences in the importance of the content of various
messages. Obviously, emergency traffic is more important than a
contentless Dx gaming contact, public serive traffic is more important
than a contentless Dx gaming contact, technical discussions and tests
are more important than contentless Dx gaming contacts, frank exchanges
of views between amateurs of various nations are more valuable than a
contentless Dx gaming contact, etc. The relative importance of any
contact is a function of the nature of the information being exchanged.
If the information exchanged is trivial or non-existant, then the contact
is of little or no value.

A very rough first order figure of merit can be obtained from the rate
of information exchange. That facilitates content exchange, and is thus
a very important factor for any communications system. If in addition we
predicate that on effective bandwidth consumed (whether in one chunk or
in many tiny slivers), we get the metric the FCC likes, bits/sec/Hz, or
in more hammy terms, WPM/Hz.

Given that metric for individual amateur stations, and given the total
available amateur bandwidth, we can then derive a number for the total
information being exchanged on an amateur band at a given time. Maximizing
that metric would be a useful goal. We often can't determine a priori what
particular bit of information will be valuable and what bit will not, but
by maximizing total information exchanged, we can increase the probability
that information of importance will be included in at least some of the
exchanges.

>After all, who can make such a judgement? A more objective figure of merit
>would be:
>
>(# of QSOs)**2 / (Hz) * (Total Equipment Cost)

Buried in that equation is a very dangerous idea, that sheer numbers
of cheap QSOs are of dominant importance, regardless of whether they
contain any information content. The purpose of communications is to
communicate content. If your metric fails to recognize this, it is
merely measuring the number of RF noise sources operating. That might
be useful on Ch 19 CB, or on a California jammer repeater, or for the
warfare on 75m where stations are running "horse races" to see who
can jam K1MAN most effectively, but I don't think it is a very good
metric for the purposes amateur radio is supposed to serve.

4380. Re: SCREW THE CODE!!

Newsgroup: rec.radio.amateur.misc
Date: 1996-10-04 00:00:00 UTC
From: gary@ke4zv.atl.ga.us
Message-ID: <1996Oct4.140942.2803@ke4zv.atl.ga.us>
Source record: 215532

In article <52o0ju$e5m@clark.zippo.com> ke4htm@bluenet.net (Jamie R. Dean) writes:
>So folks let the code war stop. It is not important. We and wasting
>bandwidth and airspace when we can't change what the FCC and ITU says.

Of course we can change what the FCC says, how do you think you got
that no-code license of yours? It took over a decade of grassroots
politicking, some of it right here on usenet, to get that implemented.
The only difference at HF is that we have to influence the ITU as well
due to the treaty requirement. We have an opportunity to do that via WRC99.
The preparatory processes for that conference are under way *right now*
in the ITU member countries. This is a pivotal moment, S25 may not
be revisited again for decades to come after WRC99. The shape of amateur
radio for the 21st century is at stake here.

This is not a waste of time, talent, or energy, much less "bandwidth".
The thing you have to realize about "bandwidth" in the context you're
using it is that the amount you don't use today is gone forever. You
can't conserve it for a rainy day.

4381. Kenwood HF radios in Truck Stops?

Newsgroup: rec.radio.amateur.misc
Date: 1996-10-04 00:00:00 UTC
From: DAVE ABSHIRE <D.R.ABSHIRE@worldnet.att.net>
Message-ID: <01bbb209$dd3f8d00$e65292cf@default>
Source record: 215533

I saw it posted some where that Kenwood Radios where going to be sold in Truck Stops. I had to go see for myself if there was any truth to the rumor, and this is what I found at there Web Sight......This is best viewed with screen Maximized....
Dave

AN IMPORTANT POLICY ANNOUNCEMENT FROM KENWOOD

Over the past several months, QST has reported that Kenwood is selling our Amateur products to CB stores and Truck Stops. We want to make it clear that this is just not true.

For years Kenwood has received thousands of requests from small electronics retailers as to how to become Authorized Amateur dealers. The majority of these requests came from Amateurs who live in communities with Amateur clubs and repeater groups. Considering that 18 states had no Authorized Kenwood dealer and 26 more states with only 1 Kenwood dealer, we agreed with these individuals that more local representation of Amateur radios and accessories was needed. Although mail-order opportunities provide low prices, it is clear that new people in the hobby want to "see" what they were purchasing and have the opportunity to go to their local dealer to purchase accessories and receive operating tips. Traveling 100's of miles was simply not practical. In addition, Kenwood also felt that exposing more people to ham radio is good for growth of the hobby. It's seems perfectly logical that smaller stores with Amateur Radio departments could exist in local areas.

The problem Kenwood faced was how to provide radios to these numerous small dealers. The decision was made to use well known established distributors who could sell radios to those businesses. Our distributors were carefully selected and interviewed. Some were selling Amateur related products and accessories. All these distributors understand their responsibilities in regards to the sale of Amateur products for licensed use only.

Kenwood is also working hard with others in the Amateur radio community to help improve public awareness of the Amateur Radio Service. Soon, we will have available a 25 page introduction brochure about Amateur Radio. This brochure is designed for adults as well as children who are interested in learning about Amateur Radio. We will also offer special Kenwood FCC license study guide packages with special prices for clubs and schools.

In closing, Kenwood wants everyone to know that we are deeply committed to Amateur Radio. We believe our plans to encourage more licensed Amateur operators is in keeping with this commitment.

NOTICE TO AMATEUR RADIO PURCHASERS

Transmitting on an Amateur Radio requires an FCC Amateur Radio License. A license is written authorization to operate an Amateur radio station. Without this FCC license to operate, you are subject to a serious fine from the Federal Communications Commission (FCC).

It's easy and fun to become a member of the Amateur Radio Service.

Contact the American Radio Relay League for more information about how to get a license.

4382. Phonetic alphabets (Alpha Bravo Charlie Delta) (revised)

Newsgroup: rec.radio.amateur.misc
Date: 1996-10-04 00:00:00 UTC
From: Brian.Kelk@cl.cam.ac.uk
Message-ID: <533d0e$rqn@lyra.csx.cam.ac.uk>
Source record: 215534
Cross-posted to: sci.lang,rec.radio.amateur.misc,rec.radio.info,rec.answers,sci.answers,news.answers

```
Archive-name: radio/phonetic-alph/full
Posting-Frequency: six weeks

Phonetic Alphabets (Alpha Bravo etc)
October 1996

There is a widely known alphabet Alpha Bravo ... Yankee Zulu.
Such alphabets are variously known as phonetic alphabets,
radio alphabets, spelling alphabets and telephone alphabets.
This collection currently includes alphabets for the
following languages:

English, French, German, Dutch, Flemish, Spanish,
Portuguese, Italian, Rumantsch, Danish, Norwegian,
Swedish, Finnish, Czech, Slovak, Polish, Hungarian,
Croatian, Serbo-Croat, Romanian, Turkish, Hebrew,
Russian, Swahili, Kwanyama, Ndonga, Chinese and
Esperanto.

This posting supersedes the one of 16th August. Changes are
minor.

My thanks to the many contributors, not all of whom are
acknowledged below.

Please report any errors. Please also mail or post any
further information or anecdotes, or specific references
where I have only second-hand information.

In my capacity as the editor of this collection I have no
objection to the further electronic distribution of this
posting in full in circumstances where it is likely to be of
interest; in the case of Web pages I ask that care be taken,
as it is easy to mangle something. Note that there is also a
brief version of this collection.

Following discussions last year this article is not now
posted to alt.usage.english. As of 10th April it is now
crossposted to various *.answers groups.

You may find a copy of this article and some other material
on the World Wide Web at:

<http://www.cl.cam.ac.uk/users/bck1/menu.html>

Copies of this article may also be found at:

***** ENGLISH *****

The NATO phonetic alphabet:

Alpha Bravo Charlie Delta Echo Foxtrot Golf Hotel India
Juliet Kilo Lima Mike November Oscar Papa Quebec Romeo
Sierra Tango Uniform Victor Whiskey Xray Yankee Zulu

[This alphabet dates from about 1955 and is approved by the
International Civil Aviation Organization, the FAA and the
the International Telecommunication Union; note that
different bodies prefer different spellings, so one also
sees: Alfa Juliett Juliette Oskar Viktor]

[The alphabet above is from the Cambridge Encyclopedia of
Language. An alphabet with Alfa X-ray can be found in The
U.S. Department of Defense Dictionary of Military Terms]

[UK police use Indigo(??) instead of India.
German army handbook 90/91: Alfa Foxtrott Juliett.
Italian version: Alfa Charly FoxTrot Giuliet Romio Wiskey.
An Indonesian phrase book: Beta Ultra Volvo Whisky X-ray.
A precursor of the present alphabet had: Alfa Coca Metro
Nectar Siera Union Whisky Extra]

Phonetics for digits (from an amateur radio FAQ):

zero one two tree fower fife six seven eight niner

From the Cambridge Encyclopedia of Language:

zero wun too tree fower fife six seven ait niner

'Telecom B':

Alfred Benjamin Charles David Edward Frederick George Harry
Isaac Jack King London Mary Nellie Oliver Peter Queen Robert
Samuel Tommy Uncle Victor William Xray Yellow Zebra

[Found also in Swedish, Dutch, Hungarian telephone
directories. An 'analogy alphabet' in a Kenyan directory
has Charlie and no Y. A Swiss directory: Andrew Charlie
Lussy Queenie Sugar. French/German vocabulary books: Andrew
Charlie Lucy Mike Nelly Sugar Xmas. English phrase books
for Spanish/Italian speakers: Charlie]

'British A':

Amsterdam Baltimore Casablanca Denmark Edison Florida
Gallipoli Havana Italia Jerusalem Kilogramme Liverpool
Madagascar New_York Oslo Paris Quebec Roma Santiago Tripoli
Uppsala Valencia Washington Xantippe Yokohama Zurich

[An 'international' alphabet in a Dutch telephone directory
has: Danemark. A 'French' alphabet in a Hungarian directory
has: Cassablanka Danemark Que'bec Upsala Zu"rich.
An 'international' alphabet in a business book for French
has: Italy Kilogram Zu"rich; the corresponding book for
German has: Italy Kilogram Xanthippe Zu"rich]

Telephone alphabet used in India:

Army Brother Cinema Doctor English Father Gold Hotel India
Jam King Lady Mother Navy Orange Paper Queen Raja Sister
Table Uncle Victory Water Xray Yellow Zero

Used by police in New York City:

Adam Boy Charlie David Edward Frank George Henry Ida John
King Lincoln Mary Nora Ocean Peter Queen Robert Sam Tom
Union Victor William X-ray Young Zebra

[Variants: Eddie Larry Nancy Thomas Yankee Yellow]

Used by police in Nassau County, Long Island, New York:

Adam Boston Chicago Denver Edward Frank George Henry Ida
John King Lincoln Mary Nancy Ocean Peter Queen Robert Sam
Thomas Union Victor William X-ray Young Zebra

Used by police in San Diego, California:

Adam Boy Charles David Edward Frank George Henry Ida John
King Lincoln Mary Nora Ocean Paul Queen Robert Sam Tom Unit
Victor William Xray Yellow Zebra

Used by police in Hutchinson, Kansas:

Adam Boy Charles David Edward Frank George Henry Ida John
King Lincoln Mary Nora Ocean Paul Q.. Robert Sam Tom Union
Victor William X-ray Yankee Zebra

Alternative phonetics sometimes used unofficially in amateur
radio:

America Boston Canada Denmark England France Germany
Honolulu Japan Kilowatt London Mexico Norway Ontario/Ocean
Pacific Radio Santiago/Spain Tokyo United Victoria
Washington Yokohama Zanzibar

[Also: Amsterdam, Baltimore, Brazil, Chile, Egypt, Finland,
Geneva, Greece, Guatemala, Hawaii, Italy, Kentucky, King,

Luxembourg, Montreal, Nicaragua, Portugal, Romania, Russia,
Sweden, Texas, Uruguay, Venezuela]

The ARRL (American Radio Relay League) alphabet (1948):

Adam Baker Charlie David Edward Frank George Henry Ida John
king Lewis Mary Nancy Otto Peter queen Robert Susan Thomas
union Victor William x-ray young zebra

[Nowadays the ARRL endorses the NATO/ICAO/ITU alphabet]

Pre-1954 U.S. Navy Radio Alphabet:

(Communications Handbook, 1945)

Able Baker Charlie Dog Easy Fox George How Item Jig King
Love Mike Nan Oboe Peter Queen Roger Sugar Tare Uncle Victor
William X-ray Yoke Zebra

"Used by Armed services of USA & GB" (ARRL Handbook, 1945)

Able Baker ... Easy ... Tare ...

Allied Services 1945:

Able Baker ... Edward ... Tape ...

From a book entitled "The Complete Morse Instructor..." (1944):

Able Baker ... Easy ... Tare ...

RAF 1943-56:

Able-Afirm ... Item/Interrogatory ... Jig/Johnny ...
Nab/Negat ... Peter/Prep ...

[In other alphabets of the Able Baker class: affirm, cast,
hypo, inter, negat, option, over, prep]

RAF 1942-43:

Apple Beer Charlie Dog Edward Freddy George Harry In
Jug/Johnny King Love Mother Nuts Orange Peter Queen
Roger/Robert Suga Tommy Uncle Vic William X-ray Yoke/Yorker
Zebra

[cf. aircraft in Dambusters raid: A-Apple B-Baker C-Charlie
E-Easy F-Freddie G-George H-Harry J-Johnny K-King L-Leather
(officially L-London) M-Mother N-Nuts O-Orange P-Popsie
S-Sugar T-Tommy W-Willie Y-York Z-Zebra]

Western Union:

Adams Boston Chicago Denver Easy Frank George Henry Ida John
King Lincoln Mary New_York Ocean Peter Queen Roger Sugar
Thomas Union Victor William X-ray Young Zero

British Army 1927:

Ack Beer Charlie Don Edward Freddy George Harry Ink Johnnie King London Monkey Nuts Orange Pip Queen Robert Sugar Toc Uncle Vic William X-ray Yorker Zebra

RAF 1924-42:

Ac Beer Charlie Don Edward Freddie George Harry Ink Johnnie King London Monkey Nuts Orange Pip Queen Robert Sugar Toc Uncle Vic William X-ray Yorker Zebra

Royal Navy 1917:

Apples Butter Charlie Duff Edward Freddy George Harry Ink Johnnie King London Monkey Nuts Orange Pudding Queenie Robert Sugar Tommy Uncle Vinegar Willie Xerxes Yellow Zebra

U.S. Army 1916:

Able Buy Cast Dock Easy Fox George Have Item Jig King Love Mike Nap Opal Pup Quack Rush Sail Tape Unit Vice Watch X-ray Yoke Zed

Try tuning across HF today. If you can't find room to squeeze in
another QSO, you aren't trying very hard. The bands simply are not
full to capacity. Until they are, people aren't going to be highly
motivated to abandon methods in which they have large sunk costs
in order to adopt more efficient techniques.

"Good enough" is always the direst enemy of "Better". That's a
fact, Jack, and there's no getting around it. If you don't recognize
this fact of life, your campaign for greater efficiency will not be
effective. First "good enough" has be become "not good enough" anymore
before large numbers of people will be motivated to change their
ways.

Computers and networking are examples of how quickly "good enough"
can change to "not good enough". In a free market, I've seen pushing
1200 baud through a telco pair go from "good enough" to laughably
insufficient in a mere decade. Today there are those who are saying
28.8 kb isn't "good enough" any longer because the content of their
communications has become richer.

But in the overly regulated and artificially tariffed insular
world of amateur radio, most amateurs are still stuck at the
1200 baud level today, or the even more laughably pitiful 300
baud, or the even more pathetic WPM of OOK Morse.

There are a number of structural reasons for this sad state of affairs. One reason is that a surprising number of amateurs just don't have much to say to each other. They are caught up in the postal card collecting game and only operate a radio as a way to facilitate that collecting activity. They don't *need* to communicate anything of substance to another person, every exchange is a carbon copy of the last. Thus they don't need a high bits/sec/Hz.

Others who may have something to say find that they still have enough "elbow room" in which to say it without resorting to more advanced techniques. SSB or FM are "good enough" for their purposes. The bands just aren't so full that another QSO can't be squeezed in. And they haven't yet discovered that their content exchanges could be much richer with better techniques.

The few amateurs who do want a highly content rich global environment, and thus need to use efficient information carrying techniques, aren't yet of sufficient number to form a critical mass to drive such a possibility toward becoming the dominant reality. And of relevance here, arbitrarily restrictive regulations and artificial protective tariffs such as the Morse tests keep those numbers from growing significantly towards critical mass.

And perhaps equally significant, wired networks have removed much of the demand for such amateur radio links. Amateur packeteers have given up on a global network and have turned to internet wormholes to interconnect their little patches of activity. Without the ability to use HF effectively to lower the hop count, the latency of solely VHF+ amateur networks makes an effective global amateur radio network an impossibility.

In a way, both you and I are trying to sell freezers to Eskimos. They just don't want or need what we have to offer. We see a thaw coming, and try to make people understand that they will need these techniques, but all they see is last year's accumulation of ice and snow and don't yet feel the heat.

Hi,

See QST Sept,Oct '96 for confirmation:

CAPMan HF Propagation Prediction Software

CAPMan - The recognized leader in HF propagation prediction software
using the proven IONCAP engine. CAPMan is a mature package for amateur
and professional alike featuring advanced
system analysis.

CAPMan now supports contour mapping with the CAPMap option. The MUF and
numerous other skywave parameters can be displayed on user selected
areas and world maps.

Visit our web site for details and sample maps and graphs.

> callsign, but not any more.

Yup, but the /6 really relates to being away from the location of the address on the Station License rather than being away from the region of call district. For example, if Jim moved to California and changed the address on the Station License (actually now just the mailing address for the single Operator and Station License) then if he was at home he would sign KH2D in California, it would be KH2D/6 when travelling near to his new home and KH2D/2 when visiting his old haunts.

>What do the suffixes attached to amateur call signs mean?
>For instance, the "7" in "KA0AAA/7", or the "AE" in "K0BB/AE"?
>
>- Gary KB0QGE

Gary,
The number after the suffix is the call area from which the op is working from since it it different from the call zone of his license. That is, he was issued a "zero" call, but is working from a "7" call zone.

The letters after the suffix are for upgrades. Signing "kt" means temporary tech plus, the license has not be issued to reflect the upgrade. Same with "AG" for general, "AA" for advanced and "AE" for Extra. An op can sign his call with the added letters as soon as he has upgraded with a Certificate of passing those elements. A general that has just upgraded to advanced can get on the HF bands a go to the advanced portion of the band and give his call with "temp AA" and would do so until the new license arrives from the FCC showing the new class, and or call sign.

4388. Novice/Tech-Plus License Classes

Newsgroup: rec.radio.amateur.misc
Date: 1996-10-04 00:00:00 UTC
From: jimkr2t@water.waterw.com

The South Jersey Radio Association is planning on conducting a series of classes to prepare students for the Novice and Technician-Plus exams. Classes will begin Tuesday, October 29, 1996, and will run for 15 weeks. Classes will be held at the Voorhees Middle School, Evesham Road and Holly Oak Drive, Voorhees, NJ. The textbook will be the ARRL's "Now You're Talking", and the registration fee of $20 will include a copy of the book for the student.

Anyone with questions or an interest in registering for the class can contact us by E-mail at jimkr2t@waterw.com or sjra@waterw.com.

Thanks and 73, Jim KR2T

actually there is no legal recourse for calling someone a liar, prrof or not.
If there were, every 7 year kid would be filing suit against his/her older/younger
brother/sister. And for the record....

LIBEL noun anything tending to degrade or asperse character or reputation
As it pertains to law.. slander written and published, the act or crime of publishing it

SLANDER noun a false tale or report, or such tales or reports colllectively, uttered
with malice and designed or tending to injure the reputation of another

In otherwords , children here on the newgroup(s) it would be considered libel and not slander. However, the courts have ruled already that actions and deeds on the various newsgroups can not be construed as libel (as of this time)

maybe when pigs fly morse requirements are eliminated that too will change, but for now, don't hold your breath

SO CUT IT OUT!!!

thought you'd like to know the legal perspective of it all

steve

No code or Know Kode it's all the same to me
5 wpm is no code

No more so than a system where people [can] change calls everytime they upgrade their license. We've had to live with a system of changing callsigns for a long time now.

I suspect that in a few more years, given no increase in the number of amateurs on HF, that "free" frequencies will be harder and harder to find, simply due to changing propagation characteristics. Its easy to have 100,000 people share limited space when two people a couple hundred miles away from each other can't hear one another. Its another thing entirely when you can work Australia on a pen-knife.

FROM THE AUSTRALIAN SPACE FORECAST CENTRE
SUMMARY FOR 04 OCTOBER AND FORECAST FOR 05 OCTOBER - 07 OCTOBER

1A. SOLAR SUMMARY
Activity: Very low

Flares: none.

Observed 10.7 cm flux/Equivalent Sunspot Number : 69/3

GOES satellite data for 03 Oct
Daily Proton Fluence >1 MeV: 1.8E+06
Daily Proton Fluence >10 MeV: 1.7E+04
Daily Electron Fluence >2 MeV: 2.1E+07 (normal)
X-ray background: A1.0
Fluence (flux accumulation over 24hrs)/ cm2-ster-day.

1B. SOLAR FORECAST
05 Oct 06 Oct 07 Oct
Activity Very low Very low Very low
Fadeouts None expected None expected None expected

Forecast 10.7 cm flux/Equivalent Sunspot Number for 05 Oct: 70/5

2A. MAGNETIC SUMMARY
Geomagnetic field at Learmonth: Quiet

Estimated Indices : A K Observed A Index 03 Oct
Learmonth 8 2221 3312
Fredericksburg 5 12
Planetary 8 13

Observed Kp for 03 Oct: 2342 2333

2B. MAGNETIC FORECAST
Date Ap Conditions
05 Oct 7 Quiet to unsettled
06 Oct 7 Quiet to unsettled
07 Oct 7 Quiet to unsettled

3A. GLOBAL HF PROPAGATION SUMMARY
Latitude Band

Date Low Middle High
04 Oct Normal Normal Normal
PCA Event : None

3B. GLOBAL HF PROPAGATION FORECAST
Latitude Band
Date Low Middle High
05 Oct Normal Normal-fair Fair
06 Oct Normal Normal Fair
07 Oct Normal Normal Fair
COMMENT: High latitude HF communication may be degraded during
local day.

4A. AUSTRALIAN REGION IONOSPHERIC SUMMARY
Date T index
04 Oct -4

Observed Australian Regional MUFs:
Darwin: No data.
Townsville: 15% depressed until 7UT then near predicted monthly values.
Sydney: 15% depressed until 7UT then near predicted monthly values
with spread F.
Hobart: 20% depressed until 11UT then near predicted monthly values
with spread F.

Predicted Monthly T index for October: 10

4B. AUSTRALIAN REGION IONOSPHERIC FORECAST
Date T index MUFs
05 Oct 0 about 10% below predicted monthly values
06 Oct 5 near predicted monthly values
07 Oct 5 near predicted monthly values

C L O S E D C I R C U I T A D V I S O R Y

Newsline report number 999 for release on Friday, October 4, 1996 to follow.

(*****
The following is a QST

The Department of Defense ends the use of Morse code in the Military Affiliate Radio System. Also, will your new vanity call be issued by lottery? Find out on Newsline report number 999 coming your way right now!

(*****
MARS BANS CW

The Department of Defense has unilaterally banned the use of Morse code on all Military Affiliate Radio System circuits. CW nets and other Morse activity in the Military Affiliate Radio System were ordered to cease operation effective October 1st.
A final CW message was transmitted simultaneously on Army, Navy and Air Force MARS frequencies at 13:00, 15:30 and 17:00 UTC on September 30th. A special certificate commemorating the demise of CW in the Military Affiliate Radio Service is available to any MARS member that correctly copied that final message.
No detailed explanation was given for by the Department of Defense for dropping the use of CW in MARS communications. Observers say that this could be the final impetus needed to get the code dropped as a mandatory testing requirement at upcoming World Radio Communications Conferences before the end of the decade.

(*****
N6NHG INDICTED

Kevin David Mitnick, N6NHG, has been indicted on new charges of carrying out a thirty month reign of software thefts that cost the nations corporations millions of dollars. The thirty three year old convicted computer hacker was charged on Thursday, September 26th with a new twenty five count indictment. An indictment that accuses him of breaking into the systems of software companies and attacking computers of Internet service providers.
News reports say that Mitnick and a co-defendant were indicted on charges that include wire fraud, impersonating company employees to gain access to computers and using cloned cellular phones and damaging computers at the University of Southern California.
Mitnick is considered one of the worlds leading experts at writing computer security breaching programs. Authorities say that this allowed him to gain access to even the most heavily guarded computer systems.
Using the internet pseudonym of Condor, N6NHG eluded investigators for two and a half years. He was eventually caught in February in Raleigh, North Carolina. This, after authorities enlisted the help of a computer security expert. In addition to this hacker tracker, the nationwide investigation involved a multi agency task force that included the Federal Bureau of Investigation, the Internal Revenue Service and the Department of Justice and NASA.
Mitnick has previously pleaded guilty in April to one federal count of cellular phone fraud and violating his parole from an earlier computer fraud conviction. That case concerned his activities between January and February of 1995 in North Carolina. This latest set of indictments alleges a set of crimes committed between June 1992 and February 1995. If convicted on all counts, Kevin David Mitnick, N6NHG could face up to 200 years in federal prison.

(*****
HAMS CHARGED IN PHONY POLICE CALLS

Three ham radio operators from Mesa, Arizona, have now been officially charged in the wake of a year long spree of false distress calls and profane broadcasts on police, fire and ham radio frequencies. The trio, reportedly led by a 16 year old Mesa Police Explorer Scout, are alleged to have faked reports of bomb scares, carjackings and robberies, and officers in distress. Investigators claim that the three also played music on emergency channels and harassed police dispatchers.
Charged in the case are 20 year old Christopher R. Johnson, KC7QPJ. And in an unusual move, police also released the identity the two 16 year old minors. They are identified as Brad E. Shelley, KC7JQY, and Joshua D. Cavender, KC7JGH. Johnson and the teenagers are accused of interfering with public safety frequencies, impersonating a police officer and false reporting.
As first reported on Newsline a month ago, it was members of the Arizona Repeater Association's Local Interference Committee located the alleged offenders. The ham radio operators also aided police and FCC inspectors in gathering enough evidence to make the arrests.

(*****
FCC FINE AGAINST COFFIELD REAFFIRMED

The FCC is holding then line on a fine that it issued against a Californian for operating without a license. The FCC has denied an application for review of a $2,000 fine against Danny Lee Coffield of Lakewood, California. This, for unlicenced operation in spectrum adjacent to the 11 meter Class D Citizens Band.
The FCC Compliance and Information Bureau had leveled the fine last year and affirmed it earlier this year. Coffield was cited for operating an unlicensed transmitter on 27.7744 MHZ back in 1993. Since that time, he obtained an Amateur Radio license.
The FCC says that it had warned Coffield of the potential penalties for unlicenced operation prior to citing him on September 29, 1993. The FCC has not indicated whether Coffield's ham license, issued in 1995, would be in jeopardy.
The Commission acted on the review application on September 19th.

(*****
NEWSLINE PAST 1000

Some good news and some bad news about our finances here at Newsline. According to our support fund administrator Andy Jarema, N6TCQ, there is enough in the way of funds now on hand to keep us in operation through early December. Unfortunately, there is not enough to take us to into 1997.
Newsline will not disappear after newscast number 1000. On the other hand we honestly cannot tell you how long we will be able to maintain service. Obviously your continued support is needed right now to keep Newsline serving you into 1997 and beyond. Our address is the:

Newsline Support Fund
P.O.Box 660937
Arcadia, California
91066

We thank you for any help you can provide.

(*****
LIKE A LOTTERY

The FCC is handling Gate 2 of the vanity call sign program almost as if it was a lottery. Gate 2 opened on September 23rd and within days the agency was deluged with requests for new calls. As of August 26th, the FCC had received 339 applications filed electronically and 4148 Paper.
The FCC says it won't start to grant new call signs until all applications for a given day are entered, whether they were filed on paper or electronically. When the agency finally starts granting new call sign requests, they will be done in random order. A lottery of sorts.
The agency also says to be patient. It could be a few weeks before your application is granted.

(*****
K1AR LEAVES CQ MAGAZINE

Some names in the news. First is John Dorr, K1AR. John has left CQ Communications to accept a new position in product marketing for Cerulean

Technologies, Inc., of Marlborough, Massachusetts. Cerulean is the result of the commercial application of DX Packet Cluster software and technology. The company recently entered into partnerships with two of the largest mobile data carriers, Bell Atlantic NYNEX Mobile and GTE Mobilnet, to give police officers on the street wider latitude in tracking down stolen vehicles and cuffing drivers with criminal warrants. Dorr says that he left CQ only because of the opportunity this represents and because of his desire to return to the Massachusetts area. He will continue to edit the magazine's Contest Calendar.

(*****
HUDSON DIVISION DIRECTOR RETIRES

And the Leagues' Hudson Division Director Paul Vydarney, WB2VUK, resigned his seat on the ARRL Board, effective September 5th. WB2VUK cited job and church obligations as preventing him from doing what he considers a proper job of fulfilling his duties as director.
Vice Director Richard Sandell, WK6R, of Scarsdale, New York, becomes director for the remainder of Vydarney's term, which expires January 1, 1997.

(*****
RCA HONORS HAMS

The Radio Club of America has announced that Carole Perry, WB2MGP, will be the recipient of its 1996 Barry Goldwater Amateur Radio Award. Perry is a secondary school teacher from Staten Island New York. She was selected based on her dedication in introducing New York City school children to the thrilling world of ham radio.
Also receiving honors from the Radio Club of America are Frank A. Gunther, W2ALS, will get a commendation named in his honor and Fred. M. Link, W2ALU, will receive the President's Award. All three will be recognized at the Radio Club of America annual banquet on Friday, November 22nd in New York City.

(*****
HAM TEACHER FEATURED IN MAGAZINE

And past ARRL Professional Teacher of the Year Sheila Perry, N0UOP, of Bloomfield, Missouri, was featured in the August edition of Learning magazine. The article highlighted her SAREX work and cited ARRL's Educational Activities Department as the place to get more information. By the way, as far as we know Carole Perry and Sheila Perry are not related to each other.

(*****
BITBUCKET

BitBucket is a newly created mailing list reflector devoted to specialized amateur radio communication techniques. This includes SSTV, ATV, FAX, Packet, Pactor, G-TOR, Clover and much more. To subscribe, send e-mail with body of message "subscribe bitbucket" to

majordomo@primenet.com

(*****
THRUWAY HAM ACKNOWLEDGMENT

The New York State Thruway Authority will help to promote ham radio. The agency has announced plans to place ARRL Amateur Radio recruitment brochures at rest stops along the toll highway.

(*****
WRC MEETING

A meeting of the worlds telecommunications leaders is taking place in Tel Aviv, Israel as we go to air. This is the 1997 World Radiocommunication Conference and several items of interest to Amateur Radio are being discussed.
Not being talked about this time is the abolition of the Morse Code a testing requirement for getting a ham ticket. That matter comes to the table in 1999. More on this WRC next week.

(*****
UK CW TEST FEE

From England, news that its going to cost more to pass a Morse Code ham radio test in the United Kingdom. The Radio-communications Agency has agreed to a rise in the fees for Morse code tests. From the 1st of September the new rates are 20 pounds Stirling for the 12 words per minute test and 15 pounds Stirling for the 5 words per minute Morse code test, in British currency.

(*****
NEW UK BEACON

A new 50 MHZ propagation beacon is now operational. As part of an experiment by the RSGB Propagation Studies Committee, Chris Deacon, G4IFX, of Darlington in County Durham, has been granted permission to use the callsign GB3IFX for his 50 MHZ tropospheric tests. The beacon transmits on 50.275MHz, on the hour, every hour, in 30 second bursts during which the callsign and time are sent twice.

(*****
NOEL EATON. VE3CJ, SK

Noel Eaton, VE3CJ the former ARRL Canadian Division Director and President Emeritus of the International Amateur Radio Union has died. According to IARU Region 2 President Tom Atkins, VE3CDM, Eaton passed away in the early hours of Saturday, September 28th. A memorial service is planned for Toronto on October 11th.

(*****
DX

Brett Graham, VR96BG, reports that hams in Hong Kong will be allowed to use several prefixes to commemorate the transfer of sovereignty over the territory from the United Kingdom to the People's Republic of China on July

1, 1997. At the request of the Hong Kong Amateur Radio Transmitting Society, Hong Kong amateurs will be allowed to change the numeral in their call sign to 96 during 1996, to 97 during 1997, and to 98 during 1998. Graham says that Hong King Amateurs began to use these new prefixes on September 10th with a contact between VS96BG and VR96GO. The Hong Kong club says it will announce later the details of a new award to be offered to amateurs for contacting stations using these special prefixes.
All Hong Kong amateurs have held licenses with call signs using the prefix VR2 for several years. Those previously holding VS6 calls are allowed to continue to use the VS prefix through July 1st of 1997. The VRA to VRZ block allocated by the ITU to the United Kingdom will be transferred to the Peoples Republic of China at that time. The only other use of that block at present by amateurs is on Pitcairn Island, where VR6 calls are still in use.

(*****
NEWSLINE CELEBRATES 1000 ON HRM

Finally, part of Newslines worldwide celebration of its 1000th newscast will take place on shortwave radio. This thanks to Len Winkler, KB7LPW of Phoenix, Arizona. Winkler has invited Newsline to be on his October 13th edition of Ham Radio and More that airs on broadcast station nationwide and on shortwave worldwide.
Joining Len will be Newsline Producer Bill Pasternak, WA6ITF and several other Newsline regulars. Bill will also have some vintage audio clips from the early days of Newsline when it was still known as the Westlink Radio Network.
Ham Radio and More airs tape delayed on radio station WWCR every Sunday at 22:00 UTC on 7.435 MHZ. WCCR is located in Nashville, Tennessee and has an effective radiated power of 100,000 watts. The show is also simulcast in Real Audio format on the World Wide Web.

(*****
And for this week, that's all from the Amateur Radio Newsline. You can write to us at:

4399. BASIC PROG (ELECTRICITY)

Newsgroup: rec.radio.amateur.misc
Date: 1996-10-04 00:00:00 UTC
From: altavoz <altavoz@worldnet.att.net>
Message-ID: <3255F794.559D@worldnet.att.net>
Source record: 215551

```
Basic program to calculate: ohm ( DC or RF ) , watts
amps , volt drop ( i use CASIO FX850 pocket calculator )
You can input all wire gages including 0 00 000 0000
once entered , values need not be entered again unless you want
change them ( hitting cr many times will recalc all )
Someday i will debug and add the other parts ( coax,DBM etc)
700 cm/amp is max recommended (cm=circular mills . )
Wire is spec'd in diameter or gage or... , so convert square mils
to cir mils by mult by pi then divide by 4.
typical inputs :
W cr : "wire"
12 cr : 12 gage, it now displays gage, dia, cir mils
cr : it now prompts for "inches"
120 cr : " " " " " "amps"
2 cr : displays rho for your selction . A "cr" will default to
copper.
7E6 cr : displays 330.3 milohms .66 volts 1.32 watts 313
cir-mils
```

```
-.1 :displays gage, dia , cir mils
cr :displays "inches"
12 * 10 cr : input 120 inches , then displays amps
100 : displays 10.37 for copper . A cr defaults to 10.37
cr : cr defaults to 0.0 htz
displays 266 milohms ...ooooppppps we didnt
change the 7 mhz back to zero . s/b 10.37 milohms
1.037 volts at DC. Remember if you dont change a variable , it
stays the same and is used in the result.
```

```
zero ( 0 ) and letter O
: separates multiple statements per line
//// is comments
C*2 is "C" mult by 2
C^2 is "C" squared
sqr is square root
N is used twice ( above line 467 its the "VAL" of input string)
M$ is input
N$ is privious input
A=amps
C=circular mils( some may not be carrying amps)
D=diameter
F=frequency
I=inches
N is scratch variable
```

```
O=ohms
R=RHO
W=watts

3 F=.001
4 N=0
5 set e5
6 r4=1e99

I have to agree, this should be available. Of course the idiotic ARRL
has opposed it saying it could be too easily faked. NO IT CAN'T NOT if
you use digital signatures. Let's do it NOW. It is idiotic to pay 50
cents to a buck or more per qsl Pretty soon some have more in qsl
expense that they do in radios. IT IS TIME to get email qsls working
AND ACCEPTED by the league.

4405. ARRL Elections a Sham, AGAIN!

Newsgroup: rec.radio.amateur.misc
Date: 1996-10-05 00:00:00 UTC
From: "William C. (Bill) Wells" <WA8HSU@netusa1.net>
Message-ID: <32566551.7382@netusa1.net>
Source record: 215360

Gentlemen:

I just received my ballot in the biannual exercise in futility known as the ARRL elections.

Here in the Central Division we were again offered no alternative in the "race" for Division Director. The only name on the ballot was that of the incumbent. This is not because other candidates did not present themselves, though!

There was at least one other candidate that I know of who had the required number of signatures on a petition who outwardly, at least, fulfilled all the requirements to run in the election. But, since his politics did not pass muster, the headquarters staff found some arcane rule which barred his running in the election.

Because of this, for Central Division Director I voted "NO" and would urge everybody else out there to do likewise.

At least for Central Division Vice-director there was a choice presented. I voted for the challenger, not because I know him to be a great guy or well qualified but because he is the challenger.

We NEED to vote out ALL incumbents and continue to do so in EVERY election until these guys all know that they serve us and not the other way around and that politics as usual is no longer acceptable.

Fellows, I think both modes have their strengths and weaknesses.
Under very difficult conditions, noise, QRM, etc it is likely that
CW will get thru better than digital modes. In normal conditions,
the digital will outstrip the CW for speed.

As for tuning, and getting set up, if you can hear the CW, you can
copy it. Tuning the signal in is much more critical on digital
modes.

And for digital modes you need a lot more equipment than just the
radio. Computer, keyboard, monitor, etc. And computers do radiate
a bunch of hash and noise.

Each mode has its time and place. And for Amateur radio purposes,
what counts is not throughput, but what the particular ham enjoys.

In favor of digital I will say that the time has finally arrived that
it is reliable enough, etc., that commercial services have adopted
it in lieu of CW. But they are channelized services, with 10 hZ
tolerance, and that is definetely not amateur radio.

> Am I correct? If I am, does anyone have any suggestions?

Gary, the mast will probably not affect it terribly, but it will do
some "damage" to the pattern.

Some people use a wood or fiberglass mast, and then run the coax
down this mast. The coax shield being a ground, I do not think
they gain one iota.

If you stack two vertical beams side by side, you can connect
them with a metal mast in between them, which in turn mounts near
the center to your tower or rotor mast. The coax follows the
masting and supports.

Many vertically polarized beams mount the beam entirely ahead of
the mast in order to avoid interaction; the idea being that since
the beam as a F/B ration of 20 db or more, the energy going back to
the mast is not enough to cause much disturbance. However, this
puts a lot of stress on the clamp and is used more often when the
beam is side mounted on the tower and can be adequately braced.
Or, you could use a dacron line (which unlike nylon doesn't stretch)
to hold up the far end of the beam.

Unless you have a critical application in mind, I wouldn't worry
about it too much.

It is good, but you have to translate it by hand and type it in
instead of pressing the "reply-to" button. My address is the
standard accepted Internet phonetic: rfg.at.nome.dot.net
where ".at." is replaced with @, and ".dot." is replaced with a period

I did it to foil the SpamBots that cruise the usenet looking for
e-mail addresses to send junk mail to. LOTS of people are doing
this now.

I tried just a plain rfg.at.nome.dot.net and my Netscape 3.0 would
not accept that unless it had an @ sign somewhere in there. So
that is the best I could come up with.

What I need to do is make up a signature file (sans cartoons, thank you)
that explains this a bit better. Sorry for the inconvenience.

meaningful test]

>So, in other words, you don't wanna play. Not with my rules, anyway.

Right ... by your own admission, later in your post (quoted below)
your test was rigged so that you "could easily win" ...

>The purpose of communications is to communicate......

Gary is right here ... pro-coders constantly assert that CW is *the
best* way to communicate ... so COMMUNICATE, as in "move some meaningful
volume of information from point "A" to point "B" ...

>What I had envisioned was a rather short test to see if the statements about
>'nobody is using CW anymore' and 'digital modes are more popular' are true.
>Which I could easily win.
>

Nobody said that no hams were using CW ... what has been said is that
"Nobody *BUT* hams are using CW any more. (to any meaningful degree)

And the fact that your proposed "test" was contrived to be to your
perceived advantage (while having virtually no meaning) was not lost on
anyone with any intelligence ...

>What you envision is a test of passing a large amount of data to see if the
>the statements 'digital modes are more effective' than CW are true. Which
>you would easily win.
>
>You obviously agree that I can make 500 contacts on CW much faster than

Who CARES ????

For example ... the CPU in the machine I'm writing this on runs at
120MHz ... CPU cycles are CHEAP ...

(even on DSPs ... I'm aware of a consumer product ... a telephone, to be
exact ... that has in its complement of devices a 50 MIPS DSP subsystem)

.. complexity (compared to a CW transmitter) is TOTALLY IRRELEVANT ...
it's HOW WELL DOES IT PERFORM? that you should be asking ...

This is the 1990s, NOT the 1930s ... as I've asked before "Hello? Is
anybody home? Wake up?!?"

I disagree ... but I know you'll hear me out ...

>It basically measures how many concurrent QSOs can take place in
>a given bandwidth. Given the variable speed at which humans generate
>information, it makes sense as it measures occupancy, not throughput.

But occupancy is not what measures spectral efficiency ... information
transfer is ... that's why the bits/sec/Hz metric is the one that's
prefered in the engineering community and by the FCC ...

As Gary points out, QSOs/Hz says nothing about how efficiently those
QSOs are being carried out, or if there's any value in the content.
Like it or not, if the content value is low enough, as Gary points out,
"QSOs/Hz" is simply a measure of the number of active noise generators.

>>>Oh yes you have. You've repeately called for a mandated change from

>substance to another person, every exchange is a carbon copy of the
>last. Thus they don't need a high bits/sec/Hz.
>

Your comment in another post about how, with sufficiently low content value, "QSOs/Hz" becomes simply a measure of the number of active noise generators clearly applies to the "QSOs" described above ... (oops, Jim will be pissed, I think I just dumped on his beloved "DEE-X")

>The few amateurs who do want a highly content rich global environment,
>and thus need to use efficient information carrying techniques, aren't
>yet of sufficient number to form a critical mass to drive such a possibility
>toward becoming the dominant reality. And of relevance here, arbitrarily
>restrictive regulations and artificial protective tariffs such as the Morse
>tests keep those numbers from growing significantly towards critical mass.
>

Agreed ... this also "serves the purpose" of the CW folks' desire to maintain the status quo ...

>And perhaps equally significant, wired networks have removed much of the
>demand for such amateur radio links. Amateur packeteers have given up
>on a global network and have turned to internet wormholes to interconnect
>their little patches of activity. Without the ability to use HF effectively
>to lower the hop count, the latency of solely VHF+ amateur networks makes
>an effective global amateur radio network an impossibility.

And the inability to achieve enough "critical mass" to get people to move to something better than 1200 baud AFSK doesn't help either ... removing the CW test and getting more technical folks involved will help.

>In a way, both you and I are trying to sell freezers to Eskimos. They
>just don't want or need what we have to offer. We see a thaw coming,
>and try to make people understand that they will need these techniques,
>but all they see is last year's accumulation of ice and snow and don't
>yet feel the heat.

Problem is, when the heat arrives, all that blubber those backward "Eskimos" have stockpiled is going to start stinking REAL bad ...

But it'll all be spoiled (bands will be sold off) before we can get enough "freezers" fielded to save it from the heat ...

Then the "Eskimos" will REALLY have something to bitch about ...

>
>- Gary KB0QGE

In the examples you gave, the /7 means that he is operating from the 7th call area instead of the 0 call area, where he is licensed. This used to be important since the FCC rules required that you identify the fact when you were away from your home station. Now they don't but some hams still do it either out of habit or just to advertise the fact.

The "AE" means that the person has upgraded to Amateur Extra class but hasn't received the paper copy of the license yet. As soon as they do, they can drop the "AE".

You will often find other things appended such as /M which means mobile, and /MM which means maritime mobile.

4418. HF Amateur Radio

Newsgroup: rec.radio.amateur.misc
Date: 1996-10-05 00:00:00 UTC
From: Jim Reid <jreid@aloha.net>
Message-ID: <01bbb25d$2649e420$76070ccf@jim-reid-1>
Source record: 215465
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.misc

There has been much posted about data through put rates,
capacity, efficiency, etc on these newsgroups of late,
mostly to point up the antiquity surrounding CW! However,
much has been implied that these other alternative, modern,
though not new techniques are better.

Well then, to what purpose have radio amateurs used the
HF bands, that is up to 30 mHz?

Since the most early days of the hobby, the thrill of THE CONTACT
has been the lure of HF; certainly not quantity nor "quality" of data,
other than the essentials to be sure a real contact had occured. This
was also true for Marconi, Tesla and Hertz--did he hear me, and I DID
hear him and responded.

That is the entire point of the QRP branch of the HF hobby: can I make
the contact! That is all that is looked for, nearly exclusively on the
very difficult to operate 160 meter band!! Can I hear anyone tonight,
and if I do, can I make a contact with him/her? That is the fun of
160 meter hamming.

Contesting -- the bane to many on contest weekends, but on those
weekends absolutely several thousand HF amateurs, all over the world,
on every continent and in well over 100 REAL countires are on the air
for 48 hours straight. Why: to make as many CONTACTS with as
many others, in as many different places, contintents and countries
as they possibly can. Expense is NOT an issue with many Super
Station Big Gun owners. As much money goes into these stations as
does any stable of Ferrari racing equipment, perhaps more. There is
one contest station in the upper Midwest with 42, count them, 42
antenna towers!! Stacks of monoband arrays, multiplt rig setups,
computer networks to every tower, rig and operaor position, etc, etc.
Why, to make a few thousand contacts at a rate of up to 300 per
hour on a given band by a given position operator at peak band
condition times. And they need skill, loads of band propogation smarts
experience, and the very BEST of equipment to do it. Why? to show
they made more contacts to more places than anyone else on the
planet during those 48 hours; it causes there adrenalin to flow
greatly for all those hours, and creates a great high!!

Someone posted the opinion that the Old Farts were just interested in
collecting postcards (QSL's). They do give assurance of THE CONTACT.
These cards are useful to the individual on a day/night when the HF
bands are dead or too noisy. Then one can look through the stack,
and relive the QSO or contact, brief as it might have been, but perhaps

very tough to have gotten through! Or, mine make a very decroative blanket of wall covering! Quite colorful many, and does impress visitors, if they happen to give a hoot about my hobby!

Secondarily, the HF bands are a meeting place for old friends, and a casual, very casual, conversation with a stranger, who just might become a new friend. These occur on both SSB and CW modes every day, and night.

So until the HF band amateur discovers another way to really have lots of fun, they way it has been since the beginning of amateur radio. I suspect they will continue having fun the old way. RTTY has been gaining in popularity the last several years, not because of a great data rate, which it isn't, but it does allow a lot of contacts with a lot of people, all over the world, especially on RTTY contest weekends. Might say RTTY has been discovered as another way to really have some fun on HF. Of course it grew out of an earlier brach of the hobby which was connecting up the old Western Union and AP mechanical RTTY gear to the HF rig! Now that was fun; even have a couple of those out here in Hawaii (did someone post that this might be the "armpit" of the Pacific, well maybe some places in the wrong part of town in Honolulu, but NOT on rural, calm, beautiful, green, garden island of Kauai!!).

So, most of the arguments being posted on these reflectors are not that meaningful to todays really active HF band amateur. He is already having a lot of fun, the old way.

Notice, I have said nothing about technical training, emergency service, etc. in this piece. However, my station did save the ship Sea Harvest from being taken over by Cuba or Caribean Pirates one very stormy June night in 1992. The only signal the ship captain could cause to pay any attention that night was not on the marine bands, but he came up into the 20 meter SSB band, 14245 actually, and yelled at me until he got my attention!!

For reasons known only to the God of propogation, my signal was the ONLY signal he could find with his on-ship gear!

We were in QSO from here on Kauai
with some guys back in the Carolinas; they could not here the ship which was obviously much closer to them than to Hawaii, peculiarity of 20 meter skip. But they did land line the Coast Guard, and my station acted as the relay for instructions. Is a very long story and has been written up in both the W5YI Report(July 1, 1992) and QST (March 1993). So real HF amateurs have, upon occasion, been of real, life saving benefit to someone in real trouble!!

Just being on the band with good equipment, a bit of wisdom, and a willingness to jump in and spend a few hours helping someone in trouble is also a part of the spirit of HF band hamming. High speed data gear, spread spectrum, etc., would have been useless in the emergency

situation above. And talk about the HIGH experienced by yours truly as a result of that encounter!

So until you guys can make it obvious to a bunch of us that there is really a lot of fun and adventure to be had using your newer modes, we old farts will go on doing it the old, lots of fun way. I grew up in a time when our first radio was "powered" by a galena crystal; a type 01A nand 30 were the first triodes I fooled with. But I was educated at University in microwaves, started out building TWTs, later on it was silicon bipolar interdigital transistors, and at the end of my prof career,
Gallium Arsenide FETS with sub-micron geometries--but it was all for analog transmission/detection modes. Well,did have a bit of time with a QPSK rig: one could connect a telephone company T1 line to the input, and out came the digital, sort of spread spectrum signal on the 2gHz common carrier band; but that was the peak of my career in newer modulation methods.

So far as I know, the only places on the HF bands where anybody cares about data through put rates are the few packet type links up around 14100 on 20 meters, and these are "closed", coded protected BBS links, not open for casual QSO'ing.

So again, until the nature of what goes on within the HF amateur bands changes, I suspect the modes in use will not see much change. What we need now are sunspots to make the propogation God smile on these bands once again; that way we can operate more hours per day trying to throw our signals to the other side of the planet on as many of the nine HF bands as we possibly can! That is what is fun!!

My experience with obtaining a license in TJ is circa 1992 ... had to
go to SCT office in TJ with copies (take several of each ...
bureaucrats LOVE paperwork) of passport, turist card, and US ham license
.. when papers are all determined to be in order, a modest fee must be
paid (in Pesos) and you get a reciprocal license ....

Again, this was in 1992 ... I can't remember the directions to the
office or the name of the official.

The best advice I can give you is to find and contact either or both of
the two major San Diego marine stores that cater to the sailboat
cruisers ... I'm afraid that I don't remember their names either, but
they're well known in the San Diego boating community ... they will know
the latest proceedures, directions, etc. for getting a Mexican
reciprocal license ...

Not exactly. September 23 marked the opening of gate 2, not 3

The general gate will no be open for quite some time. At this point, gate 2 is for holders of extra licenses and that is taking quite some time.

Gate 3 for the advanced class is next but the effective date has yet to be announced.

Here is a summary of news items covered on edition #184 of
"This Week in Amateur Radio", North America's satellite-delivered
audio bulletin service, for the week ending 11-Oct:
-
1. FCC Says Vanity Call Sign Applications Below Expectations
2. $2000 Fine Against California Amateur Affirmed by Commission
3. RAC Headquarters Move from Kingston to Ottawa Begins This Week
4. ESA Moves Closer to Launch of Phase 3-D Satellite
5. Crystal Manufacturer Closes Down after 63 Years of Operation
6. "Gateway 160 Meter Net Report" with Vern Jackson, WA0RCR
7. QST Announces Correction of Contest Date
8. Weekly Propagation Forecast
9. "Ancient Amateur Archives" w/Bill Continelli, AB2CA (ex-KE2XB)
10. ARRL DXCC Desk Reports Minimal September Backlog
11. ANS Reports STS-78 QSL Cards Still on Hold
12. Special Event Station Calendar
13. "The RAIN Dial-up" from Chicago
14. Noel B. Eaton, VE3CJ, Former IARU President, SK at Age 86
-
Funding for the program's transmission and production expense was
provided this week by a grant from Keith McQueen, N7HMF, of Orem,
Utah, where "This Week in Amateur Radio" is heard on the N7HMF
repeater on 448.025 MHz serving Provo, Orem, and Utah County.
-
"This Week in Amateur Radio" is a weekly amateur voice bulletin
service, produced by Community Video Associates, Inc., a New York
State not-for-profit corporation based in Albany, NY. The program
is heard on the "W0KIE Satellite Network" each Saturday at 9:00 PM
(EDT) on the Hughes Communications SBS-6 commercial communications
satellite, transponder 13B upper, located at 74 degrees west
longitude in equatorial geosynchronous orbit. The transponder
center frequency is 12.019 GHz; tune up in frequency to 12.031 GHz.
Program audio is on the 6.2 MHz analog subcarrier and carried on
VHF/UHF repeaters throughout North America and on 160 meters at 1860
kHz. Contact your local amateur radio club or repeater operator if
"This Week in Amateur Radio" is not being heard in your area.
-
Production and transmission expenses are underwritten by donations
```

from repeater operators, amateur radio clubs, and individuals.

Anthony R. Gold (tgold@microvst.demon.co.uk) wrote:

: Yup, but the /6 really relates to being away from the location of the
: address on the Station License rather than being away from the region
: of call district. For example, if Jim moved to California and
: changed the address on the Station License (actually now just the
: mailing address for the single Operator and Station License) then if
: he was at home he would sign KH2D in California, it would be KH2D/6
: when travelling near to his new home and KH2D/2 when visiting his old
: haunts.

Have they changed the rules in the US? It used to be that you used the
/n suffix whenever operating out of district.

If that is still true - then, in the above example, it would be KH2D
while operating anywhere in the 6th district and KH2D/n when operating
in any other district - e.g. KH2D/2 while in the second district.

Hi all,

A freind has just bought a PC to use for viewing the output of his ERA Microreader (which is attached to a Lowe HF-225). The ERA manual explains how to connect the 2 using a 2 wire cable to the serial port of the PC, but doesn't tell us if any special software is required ??. We have tried to use windows terminal to "receive a text file" but nothing happens. ANY advice would be greatly appreciated (I have been voluntered for the job of sorting it out for him, but I only understand the PC side & not the radio kit).

Thanks in advance

Well, there really are no real *rules* about this any more. These
geographical suffixes are all classified as self-assigned in 97.119
(Station identification), and so long as a suffix does not conflict
with FCC issued suffixes (or with a prefix issued by another country)
you are free to make up your own rules on this one. And yours sounds
at least as good as mine, Bill.

From:

Dennis A. Mason
damason@uswc.uswest.com

(I agree with every word, but he was too mild-Burt K1OIK).

You ham radio ops are a bunch of cheap skates. You're always trying to screw us commercial dealers out of a radio or repeater for some stupid project of your own. Most of your repeaters are all closed and are absolutely worthless for emergency use. You all claim to be such a big help in emergencies. WELL YOU'RE NOT!!! Hams can't and don't contribute anything to disaster relief any more.

All you do is whine and moan about how much a piece od commercial equipment costs. Well that isn't entirely true. You do go to hamfests and whine and moan to vendors about how much their equipment costs as well. You idiots have absolutely no idea what goes into the design production and marketing of any piece of gear, commercial or not. I truely feel sorry for any poor bastard that relies on making a living from you cheap SOB's.

Why not give us legitimate commercial interests your VHF, UHF and SHF spectrum so that we can do something useful for mankind instead of letting a bunch of retired has beens have access to billions of dollars of spectrum for nothing more than comparing prostate troubles during the day when the rest of humanity is doing something useful... like working for a living.

I'm sure to get some flame mail over this so I might as well make it good... You guys are worse than CBers. All you do is bitch about code requirements and how hard the tests are to get a license. Well I got news for you. You hams should be relegated to about 400 KHZ of spectrum in the 20 meter band. It should be allocated into 40 distinct channels 10 KHX apart. Maximum power 5 watts ERP. All testing and call signs should be revoked and every 18 wheeler should have a mass production, $50 20 meter ham rig installed. Then I suppose you all could bitch about paying a whole $50 to whoever is desperate enough to get into that market.

73zzzzz good buddies>>>

>
>The wait for Gate 2 results lets us rethink CW, bandwidth, etc. For
instance,
>the number of applications on day one is roughly 4000. If the FCC typist
(snip)

Like about 5000 other hams, I've been giving this some thought, as well. Since the FCC phone rep told me there is only one full time person doing all the logging, I've wondered if they at least hired some part time help. Here's another thing to consider. I first visualized this process working like this: all the day one entries are forwarded to the FCC, then they are simply shuffled all together, and then the poor, overworked clerk takes them (randomly), and begins entering calls 1-25 until they get a "hit", i.e., the call is available. In this way, the poor, overworked clerk only has to enter a relatively few number of calls for each applicant, at least for those first thousand or so. After the first bulge of calls, there would be more and more repeat requests, and more applicants forms would require all 25 to be typed in, and even then, some will receive no call, right?

Well, what's actually occurring, as I understand it, is that all 5000 applicants are having all 25 calls entered. Aside from the extra time this will require, has anyone considered the probable error rate in entering 125,000 mixed letter-number entries? It's too bad the FCC didn't get the electronic filing system in place in time for more hams to file electronically, (even the instruction page was blank until the 23rd - who wants to chance it not working? i mailed mine on the 20th) because I estimate human error will result in erroneous entry of a significant number of applicants' carefully chosen calls.

I really don't think the FCC planned this out very well, and probably got quite a shock when they saw the deluge that came when Gate 2 opened. There is an order of magnitude difference between the numbers of qualified applicants between the first couple of gates and Gate 2. Just wait until the next gate opens.

>HF bands, that is up to 30 mHz?
>

Mostly for games like Jim's "DEE-X" and the postcard collecting
oriented, carbon-copy, contentless "QSOs" that Gary refered to ...

>Since the most early days of the hobby, the thrill of THE CONTACT
>has been the lure of HF; certainly not quantity nor "quality" of data,
>other than the essentials to be sure a real contact had occured. This
>was also true for Marconi, Tesla and Hertz--did he hear me, and I DID
>hear him and responded.
>

In the days of Marconi, the fact that he was heard WAS unique and
exciting ... however, how many times over with "been there, done that"
before it ceases to have importance???? The first time man set foot on
the moon was a big deal ... a couple of hundred years from now when
permenant lunar bases have existed for a long time and mars has begun to
be colonized, a man on the moon will be no big deal.

This is part of the problem ... people who don't know any better, who
insist on making a big deal out of and assigning an unwarranted amount
of importance to their ham radio contacts, like there was something
marvelous and magical in the fact that "I've turned on my radio and
talked to someone in _____!!!!" Wow, I'm impressed!!! (not) ... wake up
people!!! Radio is well extablished. Has been for years. Working DX is
NOT some sort of pioneering effort that advances the communications art.

>Contesting -- the bane to many on contest weekends,

You got that right ... these ridiculous "organized jamming sessions" are
arguably a lone facet of ham radio that might merit an outright
regulatory ban ... <grin>

>Why, to make a few thousand contacts at a rate of up to 300 per
>hour

Wow, talk about content-rich, meaningful exchanges amongst intelligent
beings? (not) What a waste of energy and spectrum!!!

>Why? to show
>they made more contacts to more places than anyone else on the
>planet during those 48 hours; it causes there adrenalin to flow

>greatly for all those hours, and creates a great high!!
>

Sounds like the old ethnic joke where you give a guy a card that says:
"How do you keep a ____ busy for 48 hours? (see other side of card)"

On the other side of the card it says:
"How do you keep a ____ busy for 48 hours? (see other side of card)"

>Someone posted the opinion that the Old Farts were just interested in
>collecting postcards (QSL's). They do give assurance of THE CONTACT.

Big deal, so would a digital signature ... like signed plaintext
messages, using a public key program like PGP ...

>These cards are useful to the individual on a day/night when the HF
>bands are dead or too noisy. Then one can look through the stack,
>and relive the QSO or contact, brief as it might have been, but perhaps
>very tough to have gotten through!

Wow, that's USEFUL! (not) ... just another example of how many in the
pro-code circle seem to view life (living in the past) and assign value
(what you did "back when", not what you can do now, or what your plan to
do in the future that's even better)

>Or, mine make a very decroative blanket of wall covering! Quite
>colorful many, and does impress visitors, if they happen to give a
>hoot about my hobby!
>

I don't think that many would remain impressed with your collection of
wallpaper after finding out that the bulk of the "contacts" were just
that ... minimal contact ... "UR 599 in ___, TNX FER QSO, OM, PSE QSL,
73 <SK>"

>a couple of those out here in Hawaii (did someone post that this
>might be the "armpit" of the Pacific, well maybe some places in
>the wrong part of town in Honolulu, but NOT on rural, calm, beautiful,
>green, garden island of Kauai!!).
>
No, I was referring to Guam in response to someone's question about
"didn't Jim (K, on Guam) have anything better to do than ..." <grin>
Hawaii's nice, I've been to Oahu and Kona, only seem pics of Kauai)

>Notice, I have said nothing about technical training, emergency service,
>etc. in this piece. However, my station did save the ship Sea Harvest
>from being taken over by Cuba or Caribean Pirates one very stormy
>June night in 1992. The only signal the ship captain could cause to
>pay any attention that night was not on the marine bands, but he
>came up into the 20 meter SSB band, 14245 actually, and yelled
>at me until he got my attention!!
>

I see you managed to "save the world" without resorting to using CW ...
(congrats, not to demean your assistance to the vessel in distress, only
to point out that it was SSB, not CW)

>For reasons known only to the God of propogation, my signal was
>the ONLY signal he could find with his on-ship gear!
>

See, if we had a lot more HF hams, he'd have had an easier time finding
help.

>
>I bought some heavy duty paper, but dread cutting out these things.
>
>Any Ideas?

OK sports fans. This is not a new idea. But why doesn't somebody
perfect a system to send electronic QSLs?????

I hate QSL cards. I just printed up 500, which cost me about 60 bucks,
and now I have to go the expense to snail mail the things all over the
planet. It doesn't make sense. The allure of the paper card wore off
for me when I was a kid, collecting international SWL cards. Everytime I
send SASE's to the buro, I get back at least half EU SWL cards, which I
pay first class postage to have forwarded to me! I'm not a SW
broadcaster! I don't want to pay expensive snail mail fees to know some
guy in Poland can hear my signal. I know that already, I just worked the
ham next door to him. Get my drift, here?.

Let's get a bunch of whiz kid computer folks together and develop a
system to send and validate qso exchange by internet. Those without
internet access (whose number should be diminishing drastically in the
next few years) will simply access a local "node", maintained by local
club, whatever, even Kinko's can get you on internet. This can't be too
hard. Why don't we do it???

73,
John

>accessories. All these distributors understand their responsibilities in
>regards to the sale of Amateur products for licensed use only.

What a bunch of specious crappola. As we all know, "well known established distributors" already sell all the radios they can to Amateur Radio Stores. As far as "Amateur-related products and accessories" I can only think of one business that is well known - Rat Shack. Rat Shack will sell a 10 meter or 2 meter transceiver to anything that comes through the door. I can't imagine any other vendor, other than truck stores and CB shops. I guess in Kenwood's mind, as long as you can by coax with 70 per cent shield, then it's a ham store.

This "Policy Announcement" confirms my worst suspicions. They are not only doing what we suspect, they are crafting such lies as this to try to excuse themselves. This is one prong of a multi-tier effort to finish the job of turning ham radio into a commercial success at the expense of everything that has made it a great avocation. The other big prong is the no-code initiative.

In article <52r77t$l1l@freenet-news.carleton.ca> dg198@FreeNet.Carleton.CA (Frank Sved) writes:
>I enjoy CW and use it. Wish I could go faster. Its inclusion in the
>license, however, could be better replaced with another test more
>effective (and fair) for granting right-of-passage to full bands. Full
>bands shouldn't be accessible to everyone just for the asking, it should
>be worked for, a bit like money.

I must disagree. There is no reason for government to impose a
rite of passage. The concept of work has no inherent moral value.
Bank robbers have been known to toil very hard tunneling into
a vault, but their work has no moral value. Only if the work
itself has intrinsic value should it be prized.

There is reason for government to demand that their legitimate
concerns be met. But government should be indifferent to the
effort an applicant must expend to meet those concerns. If there
must be gradations in licensing, then the gradations should make
sense from the perspective of legitimate government concerns. In
that regard, *power* is the most appropriate differentiator of
amateur grades rather than access limits to fundamentally similar
slices of spectrum.

In line with recent government actions, perhaps we should consider
two amateur classes. The lesser class would convey amateur privileges
at a maximum power limit of 50 watts while the greater would convey
amateur privileges at a maximum limit of 1.5 kW. Framkly, I'd be
satisfied if amateur power limits were reduced to 10 watts and 100 watts
respectively for the two classes. Amateurs tend to use too much power
anyway as compensation for using inefficient modulations and codings.
However, there are a few extraordinary situations where greater powers
than those I mention might be warranted, so I'm content to accept 50 watts
and 1.5 kW as the appropriate *maximum* levels for now, with the clear
understanding that "minimum power necessary" should always be a
paramount concern among amateurs.

As a step toward encouraging amateur respect for "minimum power
necessary", I'd like to call on the contest organizing bodies
to disallow credit for contacts made with more than 50 watts
of power (except for extraordinary situations like EME, and
perhaps 160m and 80m summertime contests). That should immediately
ease a number of government concerns, and cause amateurs to
start seriously considering more efficient methods of operation.

I'm afraid that's not the answer. Many of these "zoological creatures"
of which you speak are Extras with many years tenure in the amateur
service. They have had ample opportunity to learn better ways of
operating than they exhibit. It's not that they are unaware of good
amateur practice, it is that they deliberately flout it. So a test
of the sort you suggest would be of no value.

For the vast majority of amateurs, peer pressure and good example
have served well to establish good operating behaviors. For the
few "zoological creatures" to which much reference is made, these
tools have failed. Only strong enforcement action will correct
this situation.

In general, I am opposed to government censorship of any form,
but I have no problem with government action against deliberate
jammers or those who are deliberately and consistently abusive
of others on the air. Whether they use obscene language or not
in pursuit of their jamming or abuse is irrelevant to me. I don't

mind hearing language on the air that I hear in everyday conversation
on the street. I don't expect amateurs to speak as if they were
in church while operating.

I do expect them to show others a bit of courtsey, however, by not
plopping down on top of other amateur transmissions and transmitting
with full knowledge that the frequency is currently occupied, or bursting
into irrational tirades against those operators. I do expect them to honor
97.101(b) and not attempt to enforce an ownership right to a particular
frequency because "they've been using it for years". I expect them
to *listen* each time before they transmit, and refrain from transmitting
on top of another already transmitting on the channel. This most
emphatically includes W1AW and other amateur "broadcasters" as well
as a number of "nets" which have also exhibited this behavior. There
should never be an excuse for a "frequency war" on amateur radio.
We've all got receivers, and most of us have VFOs. We should learn
to use them.

A voice of sanity and reason comes from out of the wilderness.
I think you've struck exactly the right note of reason in this
debate. I can even go along with the idea of two license classes,
one with sharply reduced privileges, May I suggest a *power limit*
of less than 50 watts would be the appropriate differentiating
factor considering the FCC's recent actions?

I've also suggested before that CW exclusive sanctuaries will
be needed in the future to protect that mode from encroachment
by more modern methods. I think that too is an excellent way
to maintain a semblence of peace on the bands. As a start, I'd
suggest the current amateur Extra segments at the bottom of HF
bands would serve nicely as sancturary.

Eventually, I'd prefer that most arbitrary government limits
be removed from our usages of amateur spectrum. I'd like to
see amateurs themselves come up with bandplans which fit their
evolving needs. Perhaps this would be a suitable role for the
IARU to play. Government could still serve an enforcement role
under the "good amateur practice" clause of the regulations if

such enforcement action became necessary.
